Central University of Rajasthan

School of Mathematics, Statistics & Computational Sciences
Department of Mathematics

Details of Revised/New Structure and Syllabus of Int. M.Sc. Mathematics w.e.f. 2023

POs (Programme Outcomes)

Students should be able to:

PO 1. Rigorous knowledge: Having rigorous and thorough knowledge of broad range of pure and applied areas of mathematics.

PO 2. Application of knowledge: Apply the knowledge of mathematics and science to the solution of complex mathematical problems.

PO 3. Problem analysis: Identify, formulate and analyze complex mathematical problems using mathematical principles.

PO 4. Development of solution: Formulate solutions for the complex mathematical problems, process, and its components.

PO 5: Conduct investigation of complex problems: Use research methods including design of experiment, analysis and observation of results to investigate and solve complex problems.

PO 6: Tool and software usages: Create, select and apply appropriate mathematical techniques, resources and software tools including modelling and prediction to complex mathematical models.

PO 7: Environment and sustainability: Understand the role of mathematics and its impact in societal and environmental contexts and demonstrate the knowledge of, and need for sustainable development.

PO 8: Individual and teamwork: Function effectively as an individual and as a member of team.

PO 9: Life-long learning: Recognize the need for and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change

PO10. Carrier Opportunities: Having opportunity to start career in academics and research institutions.

Mapping from Mission to Programme Outcomes

The mapping is based on marks 1 to 3, where “1” indicates low level matching of mission with programme outcome, “2” indicates medium level matching, and “3” indicate high level matching.

PO/Mission	M 1	M 2	M 3
PO 1	3	2	3
PO 2	2	2	3
PO 3	1	2	2
PO 4	1	2	3
PO 5	2	3	3
PO 6	1	3	3
PO 7	3	1	2
PO 8	3	2	2
PO 9	3	2	2
PO 10	2	3	3

Mapping from Programme Outcomes to Courses

The mapping is based on marks 1 to 3, where “1” indicates low level matching of course outcome with programme outcome, “2” indicates medium level matching, and “3” indicate high level matching.

2	MAT104	Mathematics-II	C	3	1	0	4
Total				3	1	0	4

Course Code **MAT 111**
Course Name **CALCULUS-I**
Credit, Mode **04, LTP:3+1+0**

Course Objectives: The main topics covered in this course will be sets, relations and functions, propositions, principles of counting, permutations and combinations, generating functions, graphs and planar graphs, trees, recurrence relations and some topics in group theory. The course also focuses in developing the understanding of the concepts of limit, continuity and differentiability of real functions together with real life applications of these concepts. The understanding of some fundamental theorems related to derivatives and their applications, together with the concept of asymptotes, curvature, convexity and concavity are core of the course.

Learning Outcomes:

1. The students will feel that a relation, which they come across in their daily life involves pairs of objects in certain order, they will learn how to link pairs of objects from two sets to introduce relations between the two objects in the pair.
2. The student will learn mathematical treatment of term relations, and will be able to differentiate relation and functions.
3. The student will be able to understand the applications of concept of limit continuity and differentiability of real functions.
4. The student will understand geometrical interpretation of mean value theorems.
5. The students would also be able to sketch the graph of functions, and curves and learn how this skill

will be applicable in finding out the area enclosed by two curves through the use of concept of definite integral.

Course Details

Unit-I: Sets and relations: Functions and their graphical representations, Different forms of Equation of a line, Limit of a function, Algebra of Limit, Continuous functions, Classifications of discontinuities, Differentiability of a function, Algebra of derivatives, Application of derivatives, Increasing and decreasing functions , Tangents and normals, Extreme values of functions. **(15 L)**

Unit-II: Mean value theorems and their geometrical interpretations , Taylor's and Maclaurin's series expansions, Successive differentiation and Leibnitz theorem; Indeterminate forms, L'Hospital Rule, Asymptotes, Curvature, Concavity and convexity, point of inflexion. **(15 L)**

Unit-III: Integration as inverse process of differentiation; Integration by substitution, Integration by partial fractions and by part, The fundamental theorem of calculus, Definite integrals and its application to find area under simple curve and area between two curves, Area of a curve using multiple integral, Change of order of integration. **(15 L)**

Recommended Reading:

1. Methods of Real Analysis by R. R. Goldberg.
2. Foundation of Differential Calculus by Euler, Translated by J.D. Blanton, Springer-Verlag, New York, 2000.
3. Calculus, Vol. 1, 2 by T. Apostol, John Wiley.
4. Mathematical Analysis by T.M. Apostal, Narosa Publishing House, 1985.
5. Differential and Integral Calculus by Shanti Narayan.

Course Code **MAT 121**

Course Name **CALCULUS-II**

Credit, Mode **04, LTP:3+1+0**

Course Objectives: The first unit of the course focus on concept of real number system, e.g., the proper understanding of the concept of limit student must be familiar with the nature and important properties of real numbers. So starting from the concept of natural number we will develop the concept of real numbers and discuss it various properties which will be helpful in discussion of other concepts in this unit. The second unit of the course based on the fact that the knowledge of matrices is necessary in various branches of mathematics. The student may be familiar with the fact that evolution of concept of matrices is the result of an attempt to obtain compact and simple methods of solving system of linear equations. But they will learn here that matrices are not only used as a representation of the coefficients in system of linear equations, but utility of matrices far exceeds that use. The students will learn about various applications of matrix notation and operations in electronic spread sheet programs for personal computer, which in turn is used in different areas of business and science like budgeting, sales projection, cost estimation, analysing the results of an experiment etc. Third unit of the course provide application of partial derivative in vector calculus. The previous knowledge of evaluation of definite integral will be used here to develop skill of evaluation of line, surface and volume integral.

Learning Outcomes:

1. The student will understand the development of concept of real number and complex number systems.

2. The students will be familiar with various properties of real numbers and their use in defining concepts like, limit, continuity and differentiability of functions of one variable and functions of two variables.
3. The student will learn how concepts and properties of matrices are important in development of society?
4. The student will understand the importance and applications of concept of definite integrals and partial derivatives of a function in evaluation of line, surface and volume integral.
5. The students will understand the applications and proof of various important theorems related to this course.

Course Details

Unit-I: Real and complex number systems, Archimedean property, Well-ordering principle, Completeness axiom, Dedekind's cuts, Nested Interval theorem , Countable and uncountable sets, Real Sequences, limit superior and limit inferior, Infinite Series, Series with arbitrary terms, Leibnitz test, Functions of two variables: continuity, partial derivatives, Differentiability, Jacobian**. (15L)**

Unit-II: Matrices of real and complex numbers, Symmetric and Skew-symmetric matrices, Hermitian and Skew-Hermitian matrices, Determinant (Properties and Examples only), Rank, Inverse, Echelon form, Solution of system of linear equations, Eigenvalues and Eigen vectors, Cayley-Hamilton Theorem, Vector product and scalar product, Introduction to vector spaces and its properties. **(15 L)**

Unit-III: Differentiation of vectors, differential operators (gradient, divergence, curl, Laplacian), Vector integration (line, surface, and volume integrals), Divergence theorem, Green's theorem and Stokes' theorem. **(15 L)**

Recommended Reading:

1. Vector Analysis by L Brand, Dover Publications, 2006.
2. Vector Analysis by Spiegel (Schaum's series)
3. Elementary Vector Analysis – C. E. Weatherburn (Vol. I & II).
4. Linear Algebra (2nd Edition) by Rao and Bhimasankaram, Hindistan Publisher.
5. Advanced Engineering Mathematics, Erwin Kreyzig (9th Edition), John Willey Ed. 2006.
6. Mathematical Analysis II, J.N. Sharma and A.R. Vasishtha, Krishna Prakashan Mandir, 1991.
7.

Level-2

Semester –III

S. No.	Course Code	Course Title	Type of Course (C/E)	L	T.	P	Credits
1	MAT201	Ordinary Differential Equations	C	3	1	0	4
Total				3	1	0	4

Semester – IV

S. No.	Course Code	Course Title	Type of Course (C/E)	L	T	P	Credits
1	MAT202	Discrete Mathematics	C	3	1	0	4
Total				3	1	0	4

Course Code MAT 231

Course Name **Differential Equations**
Credit, Mode **04, LTP:3+1+0**

Course Objective: The main focus of this course on Differential Equations is to learn various methods to solve differential equations analytically as well as to learn some of the applications of differential equations. The course begins with very basic concept related to a differential equation. It covers both linear and nonlinear first order differential equations including singular solutions in case of nonlinear differential equations. The second part of the course covers various methods for solving linear differential equations of higher order. In the last part of the course, we discuss the formulation of PDE along with various types of methods for solving linear and nonlinear partial differential equations (PDEs) of first order. The course finishes with the classification of second order PDEs.

Learning Outcomes: After completing this course, the student will be able to learn the following:

1. This course would be teaching a student what is a differential equation and what they mean by a solution of a differential equation and how to get solutions of differential equations using some known methods, what are various applications of a differential equation and how to get a differential equation from a real physical and biological processes?
2. Students will be able to learn that which method of solution is applicable for a specific differential equation. For example, when they can apply variable separable method for an ODE when the method of reduction of order is applicable to obtain a solution of a differential equation.
3. They will get good motivation and they will be able to generate certain kind of interest into the subject by observing some simple mathematical formulation of real life problems.
4. Student will also learn about the existence of a solution of a particular differential equation. Specifically, there are some differential equations which have no solution at all and there are some differential equation which have more than one solution.
5. The material of this course also underpins many later advance courses in Mathematical Modeling and Simulation, Mathematical Ecology, Mathematical Biology, Dynamical Systems and some other advanced courses related to differential equations, and thus should give students a good background for studying these more advanced topics.

Course Details

Unit-I: Order and degree of a differential equation, Ordinary differential equations of first order (linear and non-linear): Separable, Linear and reducible to linear, Homogeneous, Exact, Integrating factors, Total Differential Equations, Orthogonal trajectories, Picard's theorem, examples of non-uniqueness of solutions, First order but higher degree differential equations solvable for x, y, p., Basic concepts of singular solutions, Applications of first order differential equations. **(15 L)**

Unit-II: Second and higher order linear differential equations: Basic theory of linear differential equations, Homogeneous linear differential equations with constant coefficients and variable coefficients, Reduction of order, Change of independent variable, Method of undetermined coefficients, Applications of second and higher order differential equations. **(15 L)**

Unit-III: Formulation of PDEs, Partial Differential Equations of first order: Linear and Non-linear, Quasilinear, Semilinear, La-grange's method, Charpit's method, Linear PDE with constant coefficients, Classification of second order PDEs **. (15 L)**

Recommended Reading:

1. S.L. Ross, Differential Equations, Wiley, 2007
2. G.F. SMATons, Differential Equations with Applications and Historical Notes, McGraw Hill Education, 2017
3. Laksmikantham, Deo and Raghavendra, Ordinary differential equations, McGraw Hill Education
4. E. A. Coddington, An Introduction to Ordinary Differential Equations, Dover Publications, 1989
5. K. S. Rao, Introduction to PDEs, PHI Learning, 2011.
6. I. N. Sneddon, Elements of Partial Differential Equations, McGraw-Hill Book Company, 1988.
7. Y. Pinchover and J. Rubinstein, An Introduction to Partial Differential Equation, Cambridge University press, 2005.

Course Code **MAT 241**
Course Name **DISCRETE MATHEMATICS**
Credit, Mode **04, LTP:3+1+0**

Course Objectives: The course starts with proper introduction about discrete mathematics, then going to the sessions on mathematical reasoning and problem solving. Then it covers several counting techniques including permutation, combinations and pigeon-hole principle etc. Finally covering graph theory. In brief, the main topics covered in this course will be sets, relations and functions, propositions, principles of counting, permutations and combinations, generating functions, graphs and planar graphs, trees, recurrence relations and some topics in group theory. Moreover, this course is organised in such a way that students will be able to assimilate all units included in this course.

Learning Outcomes: The course stresses on mathematical reasoning and different ways in problem solving. After completing this course, the student will be able to learn the following:

1. This course would be teaching a student how to think logically and mathematically?
2. Students will be able to express a logic sentence in terms of predicates, quantifier and logical connectives.
3. They will learn various types of relations including equivalence and partial order relations.
4. Students would be able to use rules of inference and methods of proofs including direct and indirect proof forms: proof by contradiction and mathematical induction.
5. They will be able to use three graphical algorithms to solve problems.
6. They will also learn group and several concepts related to a group.
7. There are several applications where these discrete objects can be used like, the problem of determining the shortest route from one city to another city using graphs.

Course Details

Unit-I: Set, function and logic, Types of functions, Relations, Equivalence relations, Partial Orderings, Principle of mathematical induction, Propositions and predicates, Logic and Proofs: Proposition, Quantifiers, Rules of Inference, Proof Methods and Strategy, Combinatorics: Principles of counting, Arrangements, Permutation and Combinations, Partitions and allocations, Pigeon-hole principle **(15 L)**

Unit-II: Graphs and Planar Graphs: Graph, Multigraph, Bipartite, GraphWeighted Graphs, Directed graphs. Paths and circuits. Matrix representation of graphs, Eulerian Paths and Circuits, Walks, Paths, Cycles, Hamiltonian cycles and travelling salesman problems, Trees, Distances and Shortest Paths, Minimum spanning trees. **(15 L)**

Unit-III: Group Theory: Definition and examples of various types of groups, Subgroups, Subgroup Tests, Cyclic group, Classification of subgroups of Cyclic groups, Permutation group, Isomorphism, Properties of Isomorphisms, Cosets and Lagrange's Theorem **(15 L)**

Recommended Reading:

1. C.L. Liu, Elements of Discrete Mathematics, 2nd Ed., McGraw Hill, International Edition, 1986.

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of	
1.	Sets, Functions, Matrices, Field

Course Objective:	
1	To introduce the system of linear equations, equivalence of two systems, solutions of system of linear equations
2	To teach vector spaces, basis, dimension
3	To introduce linear transformations between any two vector spaces, eigenvalues, and eigenvectors.
4	To introduce inner product spaces and associated concepts e.g., norm, orthogonal sets

Course Outcomes: The students will be able to learn	
1.	how to analyze and solve systems of linear equations
2	that whether a given a set of vectors is a vector space, a subspace, or a basis for a vector space
3.	how to compute eigenvalues and eigenvectors, algebraic and geometric multiplicities belonging to an eigenvalue

4.	different concepts about linear transformations and inner product spaces	
5.	how to use and take help of different concepts associated with system of linear equations, vector spaces, linear transformations, and inner product spaces in advanced course on Linear Algebra	
Course Content:		
Unit-I	System of linear equations: Equivalent systems, Matrices, Elementary row operations, Row-reduced echelon matrices, Block matrices, Vector spaces: Definition, Subspaces, Linear span, Linear dependence and linear independence, Direct sums.	15 Hours
Unit-II	Basis, Dimension, Ordered bases and coordinates, Linear transformations: Definition and examples, Null spaces, Range spaces, Rank-nullity dimension theorem, Matrix of a linear transformation, Isomorphism, Change of basis	15 Hours
Unit-III	Eigenvalues and eigenvectors of linear operators, Computing eigenvalues and eigenvectors of different types of matrices, Diagonalization, Symmetric matrices, Inner product spaces: Definition and examples	15 Hours
Unit-IV	Cauchy-Schwarz inequality, Triangle inequality, Orthogonal sets and bases, Gram-Schmidt process, Induced Norm, Normed vector spaces, quadratic forms.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3

Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite:		
	Basics of real analysis and integral calculus.	
Course Objective: To develop the concept of		
1.	metric functions, different kinds of metric spaces and their properties.	
2.	continuity and completeness properties in a metric space.	
3.	compactness and characterization of metric spaces.	
4.	Riemann-integration and their properties.	
Course Outcomes: Students will be able to		
1.	identify different kinds of metric spaces and verify their properties.	
2.	verify the different properties of completeness metric space under continuity.	
3.	verify the different characteristics of a compact metric space.	
4.	check the integrability condition and different properties of Riemann-integration.	
Course Content:		
Unit-I	Definition and examples of metric spaces, distance between two set, Diameter of a set, Interior points,	15 Hours

	Open sets and its properties, Equivalent metric space, Closed sets and its properties, Adherent points, Limit points, Subspaces of a metric space, Dense set, Separable metric space. Product of metric spaces.	
Unit-II	Continuous functions on a metric space, Properties of continuous functions, Uniform continuity, Homeomorphism, Isometry, Sequences in the metric spaces, Cauchy sequence, Complete metric space, Properties of complete metric space.	15 Hours
Unit-III	Compact spaces, Countably compact spaces, Bound sets, Finite intersection property, Lebesgue number, Characterizations of compactness, Continuous functions on compact spaces.	15 Hours
Unit-IV	Riemann integration, Darboux's theorem, Riemann integrability, Fundamental theorem of integral calculus. First and second mean value theorem of integral calculus. Functions of two variables: continuity, differential and differentiability, Jacobians.	15 Hours
Internal Assessment:		
CIA*-1	Unit I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Written Exam. for Unit-I, II, III, & IV

Course Title: 3-Dimensional Geometry

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 Hours/week	**EoSE:** 60 Marks **Internal Assessment:** 40 Marks	**Theory:** 3
Tutorial: 1 Hour/week		**Tutorial:** 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	Basic Concepts of basic geometry.

Course Objective: This course aims to learn

1.	The properties of conics in two and three dimensions.
2.	The geometry of conics in two and three dimensions and their intersections.
3.	The nature of the second-degree equation.

Course Outcomes: The students will be able to understand

1.	To write mathematical representations of conics in 2 and 3 dimensions.
2.	The sketches of conic sections in 2 and 3 dimensions.

3.	The properties and intersections of the conic sections.	
4.	To identify and classify the nature of quadratic equations.	
Course Content:		
Unit-I	Straight lines in space (Symmetric & Parametric form), Direction ratio and direction cosines, Canonical equation of the line of intersection of two intersecting planes, Angle between two lines, Distance of a point from a line, Condition of coplanarity of two lines, Equation of skew-lines, Shortest distance between two lines.	15 Hours
Unit-II	Sphere: General equation, Sphere through the intersection of two spheres, radical plane, tangent, normal. Cone: Right circular cone, general homogeneous second degree equation, section of cone by a plane as a conic and as a pair of lines, condition for three perpendicular generators, reciprocal cone.	15 Hours
Unit-III	Cylinder: Generator parallel to either of axes, general form of equation, right-circular cylinder. Conicoid: Ellipsoid, hyperboloid, paraboloid, tangent planes, normal, enveloping cone, enveloping cylinder.	15 Hours
Unit-IV	Surface of revolution (about axes of reference only), ruled surface, reduction of the general equation of second degree, canonical equations only.	15 Hours
Internal Assessment:		
CIA-I*	Unit-I	
CIA-II	Written Exams/ Quizzes/ Assignment/ Presentations/ Viva-Voce based on Unit III

Course-Code: MAT304 **Course Title: Foundation of Abstract Algebra**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of	
1.	basic concepts of set theory
Course Objectives:	
1.	To teach the students the basics of groups,
2.	To teach the students the properties of group homomorphisms.
3.	To teach the students the basics of rings
4.	To introduce the concepts of irreducible polynomials.

Course Outcomes: Students will be able to learn		
1.	the construction of few groups	
2	the coset decomposition and properties of homomorphisms	
3	the structure of finite abelian groups	
4	fields and their properties	
Course Content:		
Unit-I	Introduction to Groups: examples and properties, Cyclic and Abelian group, Dihedral Groups, Order of an element of a group, Symmetric Group, Even and Odd Permutation, Alternating Group and its generators, Sub-groups	15 Hours
Unit-II	Center, Coset Decomposition of a Group, Index of a subgroup, Lagrange's Theorem, Normal subgroups, Quotient groups, Homomorphism and Isomorphism of groups, Group of Automorphisms, Inner Automorphisms, Automorphisms of cyclic groups,.	15 Hours
Unit-III	Kernel of a Homomorphism, Fundamental Theorem of Homomorphism, Cayley's Theorem, Direct Product (External and Internal) of Groups. Fundamental Theorem of Finite Abelian groups, Introduction to Rings: examples and properties, Integral Domains, Division Rings	15 Hours
Unit-IV	Fields and its Characteristics, Subrings, Ideals, Quotient Ring, Homomorphism and Isomorphism of Rings, Fundamental Theorem of Ring Homomorphism, The Field of Quotients, Polynomial Rings, Division Algorithm, Eisenstein's Criterion of irreducibility.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV

Course-Code: MAT-305
Course Title: Foundation of Complex Analysis

Teaching Scheme	Examination Scheme	Credits Allotted

Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of complex numbers, properties of complex numbers and foundation of real analysis.

Course Objective:

1	This course aim to provide an introduction of functions of a complex variable.
2	Students will be equipped with the understanding of the fundamental concepts of complex variable theory.
	To make students understand the functions of complex variable

Course Outcomes: Students will be able to

1.	evaluate limit, continuity and differentiability of function of complex variables.
2.	learn nature of basic functions of complex variable like exponential, logarithmic, trignometric and hyperbolic.
3.	find complex line integration and proof of fundamental theorems like necessary and sufficient conditions for differentiability, Cauchy Gaursat theorem, Cauchy's theorem, Cauchy's integral theorem etc.
4.	learn many results and concepts both analytically and geometrically.

Course Content:

Unit-I	Complex Numbers, Conjugation, Modulus and Argument, Geometric Interpretation of complex numbers, Extended complex plane, Square roots, Rational powers, Topology of complex plane, Sequence and series, Stereographic projection. Functions of a complex variable, Univalent functions, Mappings, Limit, Theorems on limit, Limit at infinity.	15 Hours
Unit-II	Sequence and series of functions and convergence, Continuity, Differentiation, Differentation of composite functions, Necessary and sufficient conditions for differentiability, Complex form of Cauchy Riemann equations, Polar form of Cauchy Riemann equations and Laplacian, Consequences of C-	15 Hours

	R equations, Analytic functions, Harmonic functions, Harmonic Conjugate, Milne-Thomson method.	
Unit-III	Antiderivative theorem, Power series, Uniqueness theorem for power series, Exponential function, Mappings by exponential function, Logarithmic function, Mappings by Logarithmic function, Multivalued functions and its branches, Branches and derivativs of lograrithms, Identities involving lograrithms, Complex exponents, Trigonometric functions, Hyperbolic functions, Inverses of trigonometric and hyperbolic functions.	15 Hours
Unit-IV	Curves in complex plane, Complex line integration, ML-inequality, Interchange of limit and integration, Interchange of summation and integration, Week form of Cauchy theorem, Cauchy Gaursat theorem for triangle, open convex domains and open connected domains, Cauchy's theorem, Simply and multiply connected domains, Cauchy's integral theorem, Cauchy integral formula.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV

4. Rudin W., 2006, *Real and Complex Analysis (3rd Addition)*, Tata McGraw Hill.

Course-Code: MAT-306 **Course Title: Linear and Nonlinear Programming**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of	
1.	Basic Concepts of Linear Algebra
2.	Basic Concepts of Calculus
Course Objective:	
1	To teach the students the skills to formulate real-world problems as linear programs,
2	To teach the students the theoretical principles of linear optimization.
3	To introduce different types of linear programming problems, e.g., Transportation problem, assignment problem, integer linear programming problems.
4	To teach two person zero sum game theory and its relation with linear programming problems.
5	To introduce the concepts of nonlinear programming and its underlying structure.
Course Outcomes: The students will be able to learn	
1.	the feasible, basic feasible, optimal solutions to linear programming problems, and the basic structure of linear programming problems.
2	different solution methodologies for linear programming problems.
3	how to write a dual linear programming problem, its solution methodology and how to relate two person zero sum games with linear programming problems. Few more linear

	programming problems, such as transportation and assignment problems, will be learnt.	
4	solution methodologies of integer linear programming problems and nonlinear programming problems.	
Course Content:		
Unit-I	Convex sets, extreme points, convex hull, hyper plane & polyhedral Sets, convex function and concave functions (definitions and simple examples). Concept of basis, basic feasible solution (BFS), degenerate and non-degenerate BFS. Formulation of linear programming problem (LPP),	15 Hours
Unit-II	LPP in matrix form. Graphical method of LPP. Simplex method and its geometrical interpretation. Big M method. Two Phase method, Degeneracy and cycling,	15 Hours
Unit-III	Define the dual problem and its various forms. Duality theorems, complementary slackness theorem. Dual Simplex method. Two-person zero sum game, equivalence between LPP and two-person zero sum game. Transportation problem (TP). Assignment problem (AP).	15 Hours
Unit-IV	Integer linear programming problem (ILPP), Gomory's cutting plane method, branch and bound method. Introduction to nonlinear programming problems (NLPP), Lagrange multiplier method, Karush Kuhn Tucker (KKT) conditions.	15 Hours
Internal Assessment:

LEVEL-3 (Electives) (DE)

S. No.	Course Code	Course Title	Credit	Course proposed/revised by	Remarks
1	MAT331	CALCULUS OF VARIATIONS AND INTEGRAL EQUATION	4	Dr. Kamlesh Jangid	
2	MAT332	NUMERICAL METHODS	4	Dr. Kamlesh Jangid	
3.	MAT333	Mathematics in India from Vedic Period to Modern time	4	Dr. Jai Prakash Tripathi	

Course-Code: MAT-331

Course Title: Calculus of Variations and Integral Equations

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	**EoSE:** 60 Marks **Internal Assessment:** 40 Marks	**Theory:** 3
Tutorial: 1 Hour/Week		**Tutorial:** 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	Basic concepts of differential equations.
2.	Basic concepts of calculus.

Course Objective: This course aims to learn

1.	The necessary and sufficient condition for extremum.

2.	The technique to solve the extremum problem under fixed and moving boundaries.	
3.	The different types of kernel and their properties.	
4.	The solution approaches Volterra and Fredholm integral equations under different types of kernels.	
Course Outcomes: The students will be able to learn		
1.	The variational functional, extremum, maxima, minima, Euler's equation and their properties.	
2.	The different solution methodologies of variational problems under free and moving boundary conditions.	
3.	The linear integral equation and their properties, conversion of integral equations to IVP and BVP.	
4.	The different types of kernels and their properties.	
5.	The number of fundamental mathematical ideas and techniques that lie at the core of the integral equation approach.	
Course Content:		
Unit-I	Motivation problems of calculus of variations, Variation of a functionals and its properties, Euler's equations and application, Extremals, Geodesics, Variational problems for functional involving several dependent variables and their first order derivatives.	15 Hours
Unit-II	Functionals dependent on higher order derivatives, Functionals dependent on the function of more than one independent variable, Variational problems in parametric form, Hamilton principle, variational problems with moving (or free) boundaries.	15 Hours
Unit-III	Linear integral equation and classification of conditions, Volterra integral equation, Relationship between linear differential equation and Volterra integral equation, Resolvent kernel of Volterra integral equation, method of successive substitution and successive approximation, solution of integral equation by Resolvent kernel.	15 Hours
Unit-IV	Fredholm integral equation, boundary value problems reduced to Fredholm equations, Fredholm equation of the second kind, method of successive approximation, Fundamentals-iterated kernels, constructing the resolvent kernel with the aid of iterated kernels, Integral equation with degenerate kernels, solutions of homogeneous integral equation with degenerate kernel.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	

CIA-II	Written Exams/ Quizzes /Assignment /Presentations/Viva-Voce

Course-Code: MAT-332
Course Title: Numerical Methods

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite:

Course Objectives:

1	To develop the understanding of several methods for interpolation, methods to solve algebraic and transcendental equations.

2	To develop direct and iterative methods to solve a system of linear equations, different methods to solve ODE and methods to find numerical derivative and integration of a function.	
Course Outcomes: Students will be able to		
1.	find the interpolating polynomial and its values	
2	solve an algebraic and transcendental equation	
3	evaluate derivative and integration of a function, numerically	
4	solve ordinary differential equations, numerically.	
Course Content:		
Unit-I	Finite difference operators, difference tables, Interpolation, Interpolation with equal intervals, Methods of interpolation: Newton-Gregory interpolation method, Interpolation with unequal intervals: Divided difference, Newton's formula for unequal intervals, Lagrange's interpolation formula, Central difference interpolation formulae: Central difference operators. Gauss forward, backward and modified formulae, Stirling and Bessel's central difference formulae.	15 Hours
Unit-II	Numerical differentiation and integration: method of differentiation based on interpolation, methods based on finite difference operators. Integration by Trapezoidal rule, Simpson's 1/3 rd rule, Simpson's 3/8 th rule, Weddle's rule, Newton Cotes Quadrature formula.	15 Hours
Unit-III	Numerical Solution of Algebraic and Transcendental equations: Bisection method, Regula-Falsi method, iteration method and Newton-Raphson method along with the rate of convergence.	15 Hours
Unit-IV	Numerical solution of Ordinary Differential Equations: Euler method, Modified Euler method, Picard's method, Runge-Kutta method.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/Viva-Voce

Course-Code: MAT 333
Course Title: Mathematics in India from Vadic Period to Modern time

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Prior exposure is not required

Course Objective:		
1.	To provide a glimpse of how various important mathematical ideas got evolved in India over several millennia	
2.	To the study of some of the finest intellectual achievements of humanity	
3.	to introduce in a balanced manner the primary source material (Sanskrit text) in which the technical ideas have been expressed	
4.	To discuss numbers in the Vedas, details of construction of geometrical figures	
4.	to discuss the development of mathematics in modern India , especially highlighting the work of Srinivasa Ramanujan	
Course Outcomes: The students will be able to learn		
1.	how some of the most fundamental concepts and ideas in mathematics--- starting from the decimal-place-value system to expressing a finite quantity in terms of an infinite series, as well as the foundations of calculus---got originated in India	
2.	the details of arithmetic, algebra, geometry, trigonometry and combinatorics, as discussed in the works of Aryabhata, Brahmagupta, Mahavira, Bhaskaracharya and Narayana Pandita.	
3.	the development of ideas and techniques of calculus and spherical trigonometry.	
4.	how mathematics and its practice are deeply connected with culture.	
Course Content:		
Unit-I	Introductory Overview (MDS), Vedas and Sulbasutras, Panini's Astadhyayi, Pingala's Chandahsastra, Decimal place value system, Aryabhatiya of Aryabhata	15 Hours
Unit-II	Aryabhatiya of Aryabhata and Introduction to Jaina Mathematics, Brahmasphutasiddhanta of Brahmagupta, Brahmasphutasiddhanta of Brahmagupta and The	15 Hours

	BakhshaliManuscript, Mahaviras Ganitasarasangraha, Development of Combinatorics	
Unit-III	Lilavati of Bhaskaracarya, Bijaganita of Bhaskaracarya, Ganitakaumudi of Narayana Pandita, Magic Squares, Development of Calculus in India,	15 Hours
Unit-IV	Jyanayanam: Computation of Rsines, Trigonometry and Spherical Trigonometry, Proofs in Indian Mathematics, Mathematics in Modern India	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce	
EoSE**	Unit-I, II, III, IV	

*: Continuous Internal Assessment
**: End of Semester Examination

LEVEL-3 (Self Study Course)

S. No.	Course Code	Course Title	Credit	Course proposed/revised by	Remarks
1	MAT381	Invitation to Mathematics, Curves and Surfaces	4	Dr. Jai Prakash Tripathi	

Course-Code: MAT-381 **Course Title: Invitation to Mathematics, Curves and Surfaces**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite: The student should have knowledge of		
1.	Calculus and elementary mathematics	
Course Objective:		
1	To introduce fundamental concepts in Mathematics with more precise and advanced way	
2	To make the students learn about polynomials in several variables and counting of monomials	
3	To introduce different concepts in matrices and linear transformations	

4	To introduce curve and surfaces in 2-dimensional and 3-dimensional spaces	
5.	To discuss the use of different concepts from differential geometry in the study of curves and surfaces	
Course Outcomes: The students will be able to learn		
1.	different topics in Mathematics including polynomials in several variables,	
2.	different concepts associated with a linear transformation, Transformations in Euclidean Geometry- circle inversions.	
3.	curves, surfaces and different associated concepts	
4	curves and surfaces in R^3	
Course Content:		
Unit-I	Polynomials: Interpolation, Taylor's formula, Polynomials with integer values, Polynomials in several variables, Counting monomials, Counting Principles: Basic methods, the Pigeonhole principle, the Binomial theorem, Permutations, Graphs, Recurrence relations, Bijective proofs, Functions: Continuous functions, the Intermediate value property and its applications, Fixed points, Linear transformations of the plane.	15 Hours
Unit-II	The Derivative and dilations, Higher order derivatives and the binomial theorem, Polynomial approximation to functions, Matrices: Matrices and transformations, Multiplication vs composition, Determinants as dilation factors,Polynomials applied to matrices, Matrices in probability theory. Matrices in Polynomial interpolation, the Vandermonde determinant, Conservation laws: Invariants of transformations, Discrete transformations, and applications, Transformations in Euclidean Geometry- circle inversions.	15 Hours
Unit-III	Curves in R^2 and R^3: : Level curves and locus, definition of parametric curves, tangent, arc length, arc length parameterization,	15 Hours

	How much a curve is 'curved', signed unit normal and signed curvature,rigid motions, constant curvature. Curves in R^3, principal normal and bi-normal, torsion, Curves in R^3, principal normal and bi-normal, torsion. Lecture-4: Frenet-Serret formula, : simple closed curve and isoperimetric inequality, Surfaces-1: Smooth surfaces: :Surfaces and parametric surfaces, examples,regular surface and non-example of regular surface, transition maps, Transition maps of smooth surfaces, smooth function between surfaces, diffeomorphism.	
Unit-IV	Surfaces -2: First Fundamental Form, :Surfaces of revolution, quadratic surfaces, First Fundamental Form, isometry, Conformal maps, Examples, : Curvature, normal curvature. Lecture -2:Principal curvatures,Euler's Theorem. Geometry of principal curvatures, Geodesics, Clairaut's Theorem , Pseudosphere.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce

Total				**18**	**6**	**0**	**24**

Course-Code: MAT-401 **Course Title: Linear Algebra**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite: The student should have knowledge of		

1.	Basic concepts in Linear Algebra and Matrices: System of linear equations, Matrices, Rank, Vector Spaces, Basis and Dimension	
Course Objectives:		
1	To introduce the fundamental notions of algebra of linear transformations, diagonalizability, and different canonical forms	
2	To teach the students different characterization of diagonalization of a linear operator	
3	To introduce the concept of orthonormal basis and their existence	
4	To create orthogonal and orthonormal bases: Gram-Schmidt process and use bases and orthonormal bases to solve application problems	
5	To introduce adjoints of a linear operators, unitary and normal operators.	
Course Outcomes: The students will be able to		
1.	Learn algebra of linear transformations, significance and use of eigenvalue and eigenvectors	
2.	Explain different concepts about linear transformations and inner product spaces,	
3.	Learn different characterization of diagonalization and canonical forms of a given linear transformation	
4	use and take help of different concepts associated with vector spaces, linear transformations, diagonalization and inner product spaces in other courses like functional analysis, differential equations	
Course Content:		
Unit-I	Review of vector spaces, The algebra of linear transformations, Isomorphism, Linear functionals, Annihilator, Double dual, Transpose of a linear transformation, Eigenvalues and Eigenvectors,and Eigenvectors.	15 Hours
Unit-II	Diagonalizability, Minimal Polynomial, Cayley Hamilton theorem.	15 Hours

	Invariant subspaces, Triangulability and Diagonalization in terms of the minimal polynomial, Direct-sum decompositions, Invariant direct sums.	
Unit-III	The primary decomposition theorem, Cyclic Subspaces And annihilators, Cyclic decomposition, Rational and Jordan forms. Symmetric and Skew-symmetric Bilinear Forms, Diagonalization of symmetric bilinear forms.	15 Hours
Unit-IV	Inner product spaces: Best approximation, The adjoint of linear transformation, Unitary operators, Self adjoint, Normal operators, Spectral theorem for self adjoint operators.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and Unit III	
EoSE**	Unit-I,II,III,IV

Course-Code: MAT402 **Course Title: Real Analysis**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite:	
	Basics of real analysis, metric space and integral and differential calculus.
Course Objectives: To develop the concept of	
1.	understanding and applications of different aspects of the real number system $\mathbb{R}$, in the Euclidean space $\mathbb{R}^n$.

2.	Riemann-Stieltjes integrability, properties of R-S integration and its applications.	
3.	uniform convergence of sequence and series of functions, solving problems and their applications.	
4.	bounded variation functions and their basic properties, development of derivatives as a linear transformation and understanding of important associated results.	
Course Outcomes: Students will be able to		
1.	understand and analyze the different aspects of $\mathbb{R}$, in $\mathbb{R}^n$ along with their applications.	
2.	solve the problems of Riemann-Stieltjes integration and will be able to apply/verify its properties.	
3.	understand and apply the tests of uniform convergence of sequence and series of functions along with solving problems.	
4.	verify the conditions of bounded variation functions along with applications, understand the concept of derivatives as linear transformation in $\mathbb{R}^n$ and know about the important associated results.	
Course Content:		
Unit-I	Introduction to Euclidean space, Open ball, Open and closed sets, Adherent points, accumulation points and isolated points, Closure and derived sets, Bolzano Weierstrass theorem, Cantor intersection theorem, Lindeloff covering theorem, Heine-Borel theorem, Compactness in $\mathbb{R}^n$, Compact subsets of a metric space.	15 Hours
Unit-II	Basics of Riemann-Stieltjes (R-S) integration, Existence of R-S integration, Conditions of R-S integrability, Properties of R-S integrals, First and	15 Hours

	second mean value theorems, Some important results on R-S integrability.	
Unit-III	Introduction to sequence and series of functions, Concept of pointwise and uniform convergence, Important tests for uniform convergence of a sequence and series of functions, Uniform convergence and continuity, Uniform convergence and integration, Uniform convergence and differentiation, Uniform convergence and R-S integration. Term by term differentiability and term by term integrability of series.	15 Hours
Unit-IV	Functions of bounded variations and its properties, total variations. Continuity, partial derivatives, differentiability, derivatives of functions in an open set of $\mathbb{R}^n$ into $\mathbb{R}^n$ as a linear transformations, chain rule, Jacobians and its properties. Introduction to important theorems such as Inverse function theorem, Implicit function theorem etc.	15 Hours
Internal Assessment:		
CIA*-1	Unit I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and Unit III	
EoSE**	Written Exam. for Unit-I, II, III, & IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Text Books:

1. Somasundaram, D. and Chaudhary, B., 2018, *A First Course in Mathematical Analysis* (A Corrected Edition), Narosa Publishing House, New Delhi.
2. Malik S. C. and Arora S, 2017, *Mathematical Analysis*, New Age Int. Ltd. Publishers, New Delhi.
3. Mapa, S.K., 2019, *Introduction to Real Analysis*, Levant Books, Kolkata.

Reference Books:

1. Rudin W., 2016, *Principles of Mathematical Analysis* (3rd Ed.), McGraw Hill International Edition.

2. Apostol T. M., 1996, *Mathematical Analysis* (2nd Ed.), Narosa Publishing House, New Delhi.

4. https://nptel.ac.in/courses/111106153

Course Code: MAT403

Course Title: Topology

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	Basic concepts of sets, relations
2.	Basic concepts of functions and congruences

Course Objectives:

1	To provide motivation for topology through geometry.
2	To develop understanding of geometric and topological properties.
3	To develop understanding of the concepts of general topology as simply as possible.

Course Outcomes: The students will be able to understand

1.	what are objects of study in topology and geometry?	
2	students will absorb the concepts and topics in hand without haste;	
3	students will be able to understand the significance of the concepts defined and the theorems proved here;	
4	The course will serve as a foundation for further study in analysis, in geometry and in algebraic topology.	
Course Content:		
Unit-I	Topological spaces. Open sets, closed sets. Interior points, Closure points. Limit points, Boundary points, Exterior points of a set, Closure of a set, Derived set, Dense subsets. Basis, sub base, Relative topology.	15 Hours
Unit-II	Product space, Quotient space. Continuous functions, open & closed functions, homeomorphism, Lindelof space, Separable spaces, Connected Spaces, locally connectedness, Connectedness on the real line, Components, Path connected space,	15 Hours
Unit-III	Complete space, Compact Spaces, one point compactification, compact sets, properties of Compactness and Connectedness under a continuous function, Compactness, Equivalence of Compactness.	15 Hours
Unit-IV	Separation Axioms: T0 , T1, and T2 spaces, examples and basic properties, First and Second Countable Spaces, Regular, normal, T3 & T4 spaces, Tychnoff spaces, Urysohn‟s Lemma, Tietze Extension Theorem, Tychnoff Theorem.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	

CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and Unit III	
EoSE**	Unit-I,II,III,IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Text Books:

1. Simmons G. F., 1963, *Topology and Modern Analysis*, McGraw Hill.
2. Vicker, 1996, *Topology via Logic*, Cambridge University Press.
3. Munkers, J. R., 2015, *Topology- A First Course*, Pearson Education India.
4. Joshi K. D., 2017, *Introduction To General Topology*, New Age International Private Limited, erd Ed.

Reference Books:

5. Kelley J. L., 2017, *General Topology*, *Dover Publications Inc.; Reprint edition.*

E-resources:

Course-Code: MAT404 **Course Title: Complex Analysis**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite:		
1	The student should have knowledge of complex numbers and their properties, basic foundation of real analysis and concepts of limit, continuity and differentiability for functions of complex variables.	
Course Objectives:		
1.	To introduce some topics of contemporary complex analysis.	
2.	To provide a solid, classical foundation for the subject while exposing trails leading off in interesting directions.	
3.	To prepare the student to work independently in these topics and especially to use the methods of complex analysis in other areas of mathematics.	
Course Outcomes: Students will be able to		
1.	learn the basic techniques of contemporary complex analysis as well as applications of these techniques in harmonic analysis, univalent functions theory and special functions.	

2.	evaluate integrals along a path, compute the Taylor and Laurent expansions, determine the nature of the singularities and calculating residues.	
3.	use of residue theorem to evaluate integrals.	
Course Content:		
Unit-I	Functions of a complex variable, Differentiability and Analyticity, Harmonic Functions, Contour integrals, Antiderivative, Cauchy theorem, Cauchy-Goursat theorem, Simply and multiply connected domains, Cauchy integral formula, Higher order derivatives, Morera's theorem.	15 Hours
Unit-II	Cauchy's inequality, Liouville's theorem, Fundamental theorem of algebra, Maximum modulus principle, Minimum modulus principle, Taylor's series, Laurent series, Absolute and uniform convergence of power series, Weierstrass theorem for sequence of functions. Removable singularities, poles, order and singular part of a pole, Laurent expansions, essential singularities.	15 Hours
Unit-III	Cauchy residue theorem, Residue at infinity, Evaluation of integrals, Definite integrals involving sines and cosines, Zeros of analytic functions, Uniqueness theorem, Zeros of polynomials, Argument principle, Rouche's theorem, Schwarz lemma, Schwarz-Pick lemma, Open mapping theorem.	15 Hours
Unit-IV	Conformal mappings, Scale factor, Local inverses, Mappings by elementary functions, Bilinear transformation, Basic properties of Bilinear transformation, Fixed points, Cross-ratio, Mappings of half planes onto disks, Automorphisms of unit disk, Automorphism of half planes, Mappings by $w=$ □□ , Mappings by $w=\log z$, Mappings by $w=\sin z$, Mappings by z^2 and branches of $z^{1/2}$.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit-II and III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination		

Text Books:

1. Brown J.W. and Churchill R.V., 2009, *Complex Variables and Applications*, Tata McGraw Hill.
2. Ponnusamy S., 2005, *Foundations of Complex Analysis*, Narosa Publication House.
3. Kasana H.S., 2005, *Complex Variables*: *Theory and Applications*, PHI.

Reference Books:

1. Rudin W., 2006, *Real and Complex Analysis (3rd Addition)*, Tata McGraw Hill.

E-resources:

1. https://archive.nptel.ac.in/noc/courses/noc21/SEM2/noc21-ma39

Course-Code: MAT405
Course Title: Mathematical Programming

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	basic Concepts of Linear Algebra
2.	basic Concepts of Calculus

Course Objectives:

1	To teach the students the skills to formulate real-world problems as linear and nonlinear programs,
2	To teach the students the theoretical principles of linear programming problems.

3	To introduce different types of methodologies to solve linear programming problems, e.g., simplex method, dual simplex method, revised simplex method, branch and bound method, cutting plane method.	
4	To teach how to handle multi objective optimization problems.	
5.	To introduce the concept of dynamic programming	
6.	To introduce the concepts of nonlinear programming and its underlying structure.	
Course Outcomes: The students will be able to understand		
1.	the theoretical foundations of simplex and revised simplex method.	
2	duality in LPP and Integer LPP.	
3	how to solve an optimization problem over recursion and a multi objective optimization problem.	
4	solution methodologies of nonlinear programming problems, specifically convex programming problems and quadratic programming problems.	
Course Content:		
Unit-I	Review of Linear Programming Problems-Graphical Method and Simplex Method, Theoretical foundation of Simplex Method, Revised Simplex Method,	15 Hours
Unit-II	Duality in linear programming problem, Primal-dual method, Duality theorems, Dual simplex method; Post optimality analysis. Integer Linear programming, Gomory's Cutting Plane Method, Branch & Bound Method, Integer Programming Duality,	15 Hours
Unit-III	Dynamic Programming, Bellman’s principle of optimality, Applications of dynamic programming, Multi-objective optimization problem, Goal Programming. Nonlinear programming, Solution of nonlinear programming problems with equality	15 Hours

	constraints and with not all equality constraints.	
Unit-IV	Convex Programming Problem, Constraint qualification, Lagrange Multiplier method, Kuhn-Tucker necessary and sufficient conditions for optimality of the objective function in NLPP. Quadratic programming, Wolfe's method and Beale's Method, Separable Programming.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and Unit III	
EoSE**	Unit-I, II, III, IV

Course-Code: MAT406 **Course Title: Abstract Algebra**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of	
1.	Basic Concepts of groups and rings

Course Objectives:	
1	To teach the students isomorphism theorems
2	To teach the students the Sylow theorems
3	To teach the students the properties of rings
4	To teach the students Chinese remainder theorem

Course Outcomes: The students will be able to understand	
1.	the concepts of group action
2	The class equation of groups
3	The properties of solvable groups

4	The arithmetic in rings	
Course Content:		
Unit-I	Review of groups and properties, First and second Isomorphism theorems, Conjugacy relation, Group Action, Equivalent formulation of action as a homomorphism of G to Symmetric group, Stabilizer (Isotropy) subgroups	15 Hours
Unit-II	Orbit decomposition, Class equation of an action, Conjugacy class equation, Transitive actions, core of a subgroup, Sylow subgroups, Sylow's Theorem I, II and III, p-groups and applications, Direct and inverse images of Sylow subgroups, Commutator subgroup, Normal and subnormal series, composition series, Jordan-Holder theorem.	15 Hours
Unit-III	Solvable groups, Properties of solvable groups, Simple groups, simplicity of An, Review of Rings and properties, Left and right ideal, prime ideals, maximal ideals, Prime and irreducible elements, Divisibility in an Integral Domain, Units and Associates, Irreducible elements	15 Hours
Unit-IV	Greatest Common divisor, Least Common Multiple, Euclidean domains, Maximal and prime ideals, Principal ideal domains, Divisor chain condition, Unique factorization domains, Examples and counterexamples, Chinese remainder theorem for rings and PID's, Polynomial rings over domains, Unique factorization in polynomial rings over UFD's.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV

Course-Code: MAT407 **Course Title: Qualitative Theory of Ordinary Differential Equations**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3

Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	basic concepts in Linear Algebra and Real Analysis e.g., continuity, uniform continuity, uniform convergence, system of linear equations, matrices, diagonalization
2.	elementary theory of ordinary differential equations

Course Objectives:

1.	To introduce the theory of existence and uniqueness theory of IVPs and system of differential equations.
2	To teach different types of boundary conditions and boundary value problems
3.	To introduce stability theory of linear and nonlinear differential equations.
4.	To develop some of the methods used to explore qualitative information about the behaviour of solutions of differential equations

Course Outcomes: The students will be able to

1.	explain different existence and uniqueness theorems for initial value problems
2.	Learn how to solve a given boundary value problem
3.	To use different analytical and geometrical methods to analyze the stability of solutions of a given differential equation
4.	use qualitative theory for modeling different real life problems via differential equations

Course Content:

Unit-I	General existence and uniqueness theory: Well-posedness and examples of Initial Value Problems (IVPs), Gronwall's lemma, Basic lemma and uniqueness theorem, Picard's existence and uniqueness theorem, Cauchy Peano existence theorem, Continuation of solutions.	15 Hours
Unit-II	System of linear differential equations: existence and uniqueness theorem, homogeneous linear systems, Non-homogeneous linear system, Linear systems with constant coefficients, General system and diagonalization.	15 Hours
Unit-III	Boundary-value problems (BVPs): Different types of Boundary conditions and examples of BVPs, Green's functions, Sturm-Liouville BVPs: Characteristic values and characteristic functions, Orthogonality of characteristic functions,Expansion of a function in a series of orthonormal functions. System of nonlinear differential equations	15 Hours
Unit-IV	Autonomous system, equilibrium points and their stability, Paths of autonomous linear systems, Paths of nonlinear systems, Lyapunov functions and their construction, Limit cycles and Periodic solutions, Poincare-Bendixson theory.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination

LEVEL-4 (Electives)

S. No.	Course Code	Course Title	Credit	Remarks
1	MAT431	Biomathematics	4	
2	MAT432	Probability and Mathematical Statistics	4	
3	MAT 433	Scientific Writing by LaTeX	2	
4	MAT434	Basic Programming in MATLAB	2	
5	MAT435	Numerical Analysis	4	
6	MAT436	Integral Transforms	4	
7	MAT437	Elementary Number Theory	4	

8	MAT438	Introduction to Space Dynamics	4	
9	MAT439	Fluid Dynamics	4	

Course-Code: MAT-431 **Course Title: Biomathematics**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of	
1.	basic concepts in elementary Calculus and Linear Algebra
Course Objectives:	
1	To introduce basic principles, assumptions and hypotheses for mathematical formulations of different biological systems
2	To teach the students the mathematical modeling of growth of single species and interacting populations
3	To introduce the compartmental epidemic models e.g., SIR, SEIR and SIS
4	To discuss the dynamical analysis of different models using linearization, stability analysis and bifurcation theory
5	To introduce the modeling of chemical kinetics
Course Outcomes: The students will be able to	
1.	use results from differential equations, dynamical systems, bifurcation and stability theory

	to analyze a given biological system	
2.	model a particular biological system and to predict its different dynamical behaviour	
3.	learn modeling and analysis of single species and interacting population models	
4.	do modeling and analysis of different compartmental epidemic models	
5.	to predict the disease burden and prevalence of a particular disease, long term persistence of a species	
Course Content:		
Unit-I	Introduction: Goals and Challenges of mathematical modeling in biology. Idealization and general principles of model building, Different types of mathematical models in biology, Bacterial growth, Relevant mathematical techniques: Non-dimensionalization, Steady states and linearization	15 Hours
Unit-II	Review of linear systems, Stability analysis, Phase diagrams, Single Species population models (discrete and continuous): Exponential, Logistic, and Gompertz growth, Allee effect, Harvesting models and bifurcations, Delay models	15 Hours
Unit-III	Models with interacting populations: Different types of interactions and examples, Lotka Volterra Competition, Predator-prey model, Chemostat models, Structured (spatial, age and sex) population models, Population biology of infectious diseases: Classification of infectious diseases, SIR, SIRS and SIS epidemic models,	15 Hours
Unit-IV	Basic reproduction number, Models for molecular events: Michaelis-Menten enzyme example, Timescale decomposition, Quasi steady state analysis, sigmoidal functions, multisite systems, Chemical kinetics: Mass action law, Hopf-bifurcations, Subcritical Hopf, Poincare-Bendixson-I, Poincare-Bendixson-II, Index Theory.	15 Hours

Internal Assessment:

CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I, II, III, IV

Course-Code: MAT432
Course Title: Probability Theory and Mathematical Statistics

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	basic concepts of linear algebra and calculus

Course Objectives:

1.	To present the type of the data and tabulate statistical information given in descriptive form and to use graphical techniques to interpret.
2.	To discuss probability, probability distributions, joint probability distributions and concepts associated with a random variable.
3.	To explain essential tools for statistical analyses.
4.	To discuss central limit theorem and order statistics.

Course Outcomes: Students will be able to

1.	learn descriptive statistics and to calculate probability for various types of problems.
2.	work out various probability distributions and statistical tools.
3.	explain order statistics and central limit theorem

Course Content:

Unit-I	Exploratory data analysis: summary statistics, box and whisker plots, histogram, P-P and Q-Q plots. Random Experiment and its sample space, probability as a set function on a collection of events, stating basic axioms, random variables, c.d.f., p.d.f., p.m.f.	15 Hours

Unit-II	absolutely continuous and discrete distributions, Some common distributions (Negative Binomial, Pareto, lognormal, beta, etc). Transformations, moments, m.g.f., p.g.f., quantiles and symmetry. Random vectors, Joint distributions, copula, joint m.g.f. mixed moments, variance covariance matrix.	15 Hours
Unit-III	Independence, sums of independent random variables, conditional expectation and variances, compound distributions, prior and posterior distribution, best predictors. Sampling distributions of statistics from univariate normal random samples, chi-square, t and F distributions.	15 Hours
Unit-IV	Order statistics and the distribution of rth order statistics, joint distribution of rth and sth order statistics. Statement and application of central limit theorem for a sequence of independent and identically distributed random variables.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and Unit III	
EoSE**	Unit-I, II, III, IV

Course-Code: MAT433 **Course Title: Scientific Writing by LaTeX**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 1 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 1
Practical: 2 Hours/Week		Practical: 1
		Total: 2
Course Prerequisite: The student should have knowledge of		
	Basic computer skills to downloads the required files and programmes needed for the course	
Course Objectives:		
1.	Installation of scientific typing tools and writing environment to create documents	
2.	To introduce typing tools e.g., LaTeX, Open office	
3.	To introduce different commands and mathematical symbols	

4.	To discuss the use of template to create impressive documents for Master and PhD thesis	
5.	To make students learn how to write equations, plot graphs, and prepare presentations.	
Course Outcomes: Students will be able to		
1.	learn how to create a scientific document	
2.	write equations, letters and do different types of mathematical calculations	
3.	include Tables, Figures and Plots in a documents	
4	create professional presentations	
5.	cite a paper and build Bibliography	
Course Content:		
Unit-I	Installing LateX and Class files, Creating first LaTeX document, creating documents in overleaf, Basic document spacing, Basic typesetting	11 Hours (4 Hours Theory and 7 Hours Practical)
Unit-II	mathematical Symbols and Commands, Writing of simple article, letters and applications, Mathematical symbols and commands, arrays, formulas and equations, Spacing, Borders and Colors	11 Hours (3 Hours Theory and 8 Hours Practical)
Unit-III	Figure environments, Subfigures, Tables, LateX presentations using Beamer, Creating different templates, Preparation of template of thesis and books	11 Hours (4 Hours Theory and 7 Hours Practical)
Unit-IV	Poster and CV templates, Pictures and Graphics, Bibliography, Writing of research articles and reports etc.	12 Hours (4 Hours Theory and 8 Hours Practical)
Internal Assessment:

Course Title: Basic Programming in MATLAB

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 1 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 1
Practical: 2 Hours/Week		Practical: 1
		Total: 2

Course Prerequisite: The student should have knowledge of

	Basic computer skills to download the required files and programmes needed for the

	course	
Course Objectives:		
1.	To introduce students to computational methods using MATLAB	
2.	To teach the basis of computational techniques for solving ordinary differential equations	
3.	To introduce the use of MATLAB for numerical integration and interpolations	
4.	To discuss different types of plotting (2D, 3D, contour etc.) using MATLAB	
Course Outcomes: Students will be be able to		
1.	Learn different environment of MATLAB	
2.	do symbolic computations using MATLAB	
3.	solve a system of differential equations via MATLAB	
4.	Learn different types of plotting namely, 2D, 3D, contour etc.	
5.	do numerical integration and interpolation with unequal intervals	
Course Content:		
Unit-I	The MATLAB Environment, MATLAB Basics: Variables, Numbers, Operators, Expressions, Input and output, Vectors, Arrays: Matrices. Built-in Functions and User defined Functions, Files and File Management: Import/Export, Basic 2D, 3D plots, Graphic handling, Use of MATLAB in Matrix Addition, multiplication, subtraction. Symbolic Calculation-symbols, differentiation, integration, etc. Conditional Statements, Loops.	15 Hours
Unit-II	MATLAB Programs: Programming and Debugging. Mathematical Computing with MATLAB-Algebraic equations. Basic Symbolic Calculus and Differential equations, Ordinary Differential Equations: A first order and first degree ODE. Interpolation with equal Interval: Newton – Gregory forward and backward interpolation formula. Numerical Integration: Trapezoidal method, Numerical Integration: Simpson method (1/3 and 3/8).	15 Hours
Internal Assessment:

Course-Code: MAT435
Course Title: Numerical Analysis

Teaching Scheme	Examination Scheme	Credits Allotted
Theory: 3 Hours/Week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory:3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The students should have knowledge of

1.	differential calculus
2.	difference operator, ODE

Course Objectives:

1	To introduce different numerical methods and their error to solve systems of linear equations, nonlinear equations, initial value problems and eigenvalue problems.
2	to analyze the notion of interpolation and approximation.
3	To provide the numerical treatment for the BVP governed by ODE

Course Outcomes: The students will be able to

1	apply a finite difference method to find the interpolation, differentiation and integration for the given discrete data values.
2	analyze and choose the best suitable numerical method for the given mathematical problem.
3	apply the numerical techniques to solve research problems of fluid dynamics, mathematical modeling.

Course Content:

Unit-I	Introduction to significant digits and errors, Solution of system of linear Equations (direct methods, Iterative methods, Ill-conditioned systems), Eigenvalue problem: Gershgorin circle theorem, power method, Jacobi method, Householder method.	15 Hours

Unit-II	Finite difference operators, difference tables, Lagrange interpolation, Newton's divided difference interpolation, Hermite interpolation, Cubic spline interpolation.	15 Hours
Unit-III	Numerical solution of ordinary differential equations: initial value problems, existence and uniqueness of the solution of initial value problem, Single step methods- Taylor series, Picard's method, Euler's method, modified Euler method, Runge-Kutta method, Multi-step methods: Predictor-corrector method, Stability Analysis.	15 Hours
Unit-IV	Boundary value problems (BVPs), Methods to solve BVPs: Finite-difference method, The Shooting method, The Cubic Spline method.	15 Hours
Internal Assessment:		
CIA*-I	Unit-I, II	
CIA*-II	Written Exams/ Quizzes/Assignment/Presentation/Viva-Voce	
EoSE**	Unit-I, II, III, IV	
*: Continuous Internal Assessment **: End of Semester Examination

Course-Code: MAT436
Course Title: Integral Transforms

Teaching Scheme	Examination Scheme	Credits Allotted
Theory: 3 Hours/Week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory:3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of

1.	basic concepts of Differential Calculus
2.	basic concepts of Integral Calculus

Course Objectives:

1	To describe the ideas of Laplace transform, Fourier transform, Z-transform and Wavelet Transform
2	To familiarize the students with the applications of the Laplace and Fourier transforms in the fields such as application of PDE, Digital Signal Processing, Theory of wave equations.
3	To familiarize the students with the applications of the Z-transform to solve the difference equations.

Course Outcomes: Students will be able to

1	gain the idea that by applying the theory of Integral transform the problem from its original domain can be mapped into a new domain where solving problems becomes easier.
2	apply these techniques to solve research problems of signal processing, data analysis and processing, image processing, in scientific simulation algorithms etc.

3	apply these transform techniques to solve the physical problem governed by ODE, PDE and difference equations.

Course Content:

Unit-I	Laplace Transform-Definition and its properties, Laplace transform of some standard functions, Existence conditions for the Laplace Transform, Shifting theorems, Laplace transform of derivatives and integrals, Inverse Laplace transform and their properties.	15 Hours
Unit-II	Laplace Transform—Convolution theorem, Initial and final value theorem, Laplace transform of periodic functions, error functions, Heaviside unit step function and Dirac delta function, Applications of Laplace transform to solve ODEs and PDEs.	15 Hours
Unit-III	Fourier transforms: Fourier integrals, Fourier sine and cosine integrals, Complex form of Fourier integral representation, Fourier transform, Fourier transform of derivatives and integrals, Fourier sine and cosine transforms and their properties, Convolution theorem, Applications of Fourier transforms to Boundary Value Problems.	15 Hours
Unit-IV	Z-Transform: Z–transform and inverse Z-transform of elementary functions, Shifting theorems, Convolution theorem, Initial and final value theorem, Application of Z-transforms to solve difference equations.	15 Hours

Internal Assessment:

CIA*-I	Unit-I, II	
CIA*-II	Written Exams/ Quizzes/Assignment/Presentation/Viva-Voce	
EoSE**	Unit-I, II, III, IV	

*: Continuous Internal Assessment; **: End of Semester Examination

Course-Code: MAT437 **Course Title: Elementary Number Theory**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite: Students should have knowledge of		
1.	basic concepts of sets	
Course Objectives:		
1	To teach the students integers and their properties	
2	To teach the students the congruences	
3	To teach the students the arithmetic functions	
4	To teach the students binary quadratic forms	

Course Outcomes: Students will be able to		
1.	Learn the concepts of linear Diophantine equation	
2	use the modular arithmetic	
3	learn the primitive root theorem	
4	discuss the binary quadratic forms	
Course Content:		
Unit-I	Division in integers, Greatest common divisor, Euclid's Algorithm, Linear Diophantine equations, Prime numbers, Fundamental Theorem of arithmetic, Distribution of primes, Greatest integer functions	15 Hours
Unit-II	Congruence relation, Properties of Congruence relation, Linear Congruences, Solvability of Linear congruence, modular arithmetic, Residue classes and reduced residue classes, Fermat's little theorem, Wilson's theorem, Euler's theorem Chinese remainder theorem, Higher degree polynomial congruence, Polynomial congruence mod p^r	15 Hours
Unit-III	Quadratic residues, Legendre Symbol, Primitive root theorem, Arithmetic functions □(□), □(□), □(□), □(□), Ring of Arithmetic functions, Multiplicative arithmetic functions, Möbius inversion formula, Perfect numbers	15 Hours
Unit-IV	Representation of an integer as a sum of two and four squares, Diophantine equations $x^2+y^2=z^2$ and $x^4+y^4=z^4$. Binary quadratic forms and Equivalence of quadratic forms, Farey sequences	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	

CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on III

Course-Code: MAT438
Course Title: Introduction to Space Dynamics

Teaching Scheme	Examination Scheme	Credits Allotted

Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite:	
	Basics of linear algebra, analytical geometry, differential equations, and vector calculus.
Course Objective: To develop the concept of	
1.	kinematics of particles, understanding of different orbital paths and elaboration of conservation laws.
2.	two body problems and its application in space and visualization of Kepler's laws of planetary motion.
3.	existence of integrals in three-body problem, applications of stable equilibrium points of the restricted problem of three bodies and importance of the Jacobi integral.
4.	rocket dynamics, performance measuring parameters and needs multi-stages rockets.
Course Outcomes: Students will be able to	
1.	know about the kinematics of particles, understand about different orbital paths of particles and verify the conservation laws.
2.	solve the two body problem, verify Kepler's laws of planetary motion and visualize the application of two body problems in space.
3.	verify the existence of integrals in a three-body problem, determine and examine the stability of equilibrium points in the restricted problem of three bodies and know the importance of the Jacobi integral.

4.	know about rocket dynamics, estimate the performance parameters and understand about the needs of optimized multi-stages rockets.	
Course Content:		
Unit-I	Some basic definitions, Conservation laws, Newton's laws of motion, Kinematics of particles, Conic-section, Central force motion, Differential equation of orbit and its solution, Geometry of different kinds of orbits.	15 Hours
Unit-II	Formulation of problem of two-body and equations of motion, relative equation of motion of two body problem, Solution of two body problem and its application. Kepler's law of planetary motion, Kepler's equation and its solution, Uniform rotating frame.	15 Hours
Unit-III	Introduction of three body problem, Ten known integrals, Stationary solutions of three body problem and applications, Restricted problem of three body, Jacobi integral, prohibited regions of motion, collinear and noncollinear equilibrium points, Stability analysis of equilibrium points, Applications of restricted problem of three body in space.	15 Hours
Unit-IV	Equation of variable mass, introduction of rocket theory, governing equation of a rocket, Single-stage rocket and its performance, Effect of gravity on the dynamics of a rocket, two-stage rocket and its performance, multi-stage rocket, Optimization of multi-stage rocket.	15 Hours
Internal Assessment:		
CIA*-1	Written Exam.	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce	
EoSE**	Written Exam. for Unit-I, II, III, & IV	
*: Continuous Internal Assessment		

**: End of Semester Examination

Course-Code: MAT-439

Course Title: FLUID DYNAMICS

Teaching Scheme	Examination Scheme	Credits Allotted
Theory: 3 Hours/week	**EoSE:** 60 Marks **Internal Assessment:** 40 Marks	**Theory:** 3

Tutorial: 1 Hour/week		**Tutorial:** 1
		Total: 4

Course Prerequisite: Students should have knowledge of	
1.	basic concepts of differential equations.
2.	basic concepts of calculus
Course Objectives: This course aims to learn	
1.	the basics characteristics of fluid, continuum hypothesis, kinematics of fluids.
2.	the Eulerian and Lagrangian methods for fluid motion.
3.	the Conservation Laws in different coordinate systems and boundary conditions.
4.	the irrotational and rotational flows
5.	the solution process of simplified examples.
Course Outcomes: Students will be able to learn	
1.	the fluid properties, continuum hypothesis, strain rate tensor, streamline, path line, streak lines, stream function and vortex lines.
2.	the stress tensor, symmetry of stress tensor, transformation of stress
3.	the Eulerian and Lagrangian hypothesis and their differences.
4.	the conservation law and their equations.
5.	the methods of implementing fluid dynamics laws.
6.	a number of fundamental mathematical ideas and techniques for the solution of related problems.

Course Content:

Unit-I	Physical Properties of fluids. Concept of fluids, continuum hypothesis, density, specific weight, specific volume, kinematics of fluids: Eulerian and Lagrangian methods of description of fluids, equivalence of Eulerian and Lagrangian method, general motion of fluid element, integrability and compatibility conditions,	15 Hours

Unit-II	Strain rate tensor, streamline, path line, streak lines, stream function, vortex lines, circulation. Stresses in Fluids: Stress tensor, symmetry of stress tensor, transformation of stress components from one coordinate system to another, principal axes and principal values of stress tensor, conservation of mass,	15 Hours
Unit-III	Conservation of momentum, Navier Stokes equation, conservation of moments of momentum, equation of energy, basic equations in different coordinate systems, boundary conditions.	15 Hours
Unit-IV	Irrotational and Rotational Flows : Bernoulli's equation, Bernoulli's equation for irrotational flows, two dimensional irrotational incompressible flows, Blasius theorem, circle theorem, sources and sinks, sources sinks and doublets in two dimensional flows.	15 Hours

Internal Assessment:

Course-Code: MAT501 **Course Title: Functional Analysis**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3

Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite:	
	Basics of linear algebra, metric space and real analysis.
Course Objectives: To develop the concept of	
1.	the normed linear space and its completeness property.
2.	linear transformation and operator in normed linear spaces and its properties along with elaboration of open mapping theorem, closed graph theorem, uniform boundedness principle, Hahn Banach theorem, and natural Embedding of normed linear spaces.
3.	Hilbert spaces and its different properties, orthogonality and elaboration of Projection theorem, Bessel's inequality and Riesz's theorem.
4.	different operators in a Hilbert space and elaboration of spectral theorem on a finite dimensional Hilbert space.
Course Outcomes: Students will be able to	
1.	verify the conditions of normed linear space and test the completeness property
2.	verify the different properties of linear transformation and operators and understand the open mapping theorem, closed graph theorem, uniform boundedness principle, Hahn Banach theorem, and natural Embedding of normed linear spaces.
3.	recognize the different properties of Hilbert space and orthogonal sets and understand the Projection theorem, Bessel's inequality and Riesz's theorem.
4.	learn about different operators and understand the spectral theorem on a finite

	dimensional Hilbert space.	
Course Content:		
Unit-I	Normed linear spaces, Examples and properties, Equivalent norms, Convexity and completeness, Banach spaces, Examples and properties, l^p spaces, L^p spaces, Function space, Quotient Space	15 Hours
Unit-II	Operators on normed linear space, Continuous linear transformations, Bounded linear transformations, The open mapping Theorem, The closed graph theorem, The conjugate of an operator, The uniform boundedness principle, Hahn Banach Theorem, Embedding of normed spaces.	15 Hours
Unit-III	Inner product spaces, Examples and properties, Hilbert spaces, Examples and properties, Polarization identity, Orthogonality, Orthogonal complements, Orthogonal Projection on Hilbert spaces, Projection theorem, Bessel's inequality, Riesz's theorem, Existence of orthogonal basis in Hilbert spaces.	15 Hours
Unit-IV	The adjoint of an operator, Self adjoint operators, Normal and unitary operators, projections, Eigenvalues and eigenvectors of an operator on a Hilbert space, The spectral theorem on a finite dimensional Hilbert space.	15 Hours
Internal Assessment:		
CIA*-1	Unit I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Written Exam. for Unit-I, II, III, & IV

Course-Code: MAT 502
Course Title: Mathematical Modeling

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of

1.	basic concepts in Linear Algebra and Real Analysis and Differential Equations

Course Objectives:

1.	To introduce students to the elements of the mathematical modeling process

2.	To learn different types of mathematical models and their nature.	
3.	To exemplify the value of mathematics in problem solving	
4.	To develop students' capacity to solve problems through the use of mathematical models as a transferable process that will equip them to address novel problems in future.	
4.	To develop some of the methods used to explore qualitative information about the behaviour of solutions of differential equations	
Course Outcomes: The students will be able to learn		
1.	the unique system characterization approach for a given system	
2.	identify assumptions which are consistent with the context of the problem and which in turn shape and define the mathematical characterization of the problem	
3.	how to analyze a given model system using mathematical analysis results.	
4.	to revise and improve mathematical models so that they will better correspond to empirical information and/or will support more realistic assumptions	
2.	different types of mathematical models in ecology, epidemiology, chemistry, Physics, Life Sciences, Engineering etc.	
Course Content:		
Unit-I	Introduction to modeling. Definition of System, classification of systems, classification and limitations of mathematical models, Methodology of model building, modeling through ordinary differential equations:	15 Hours
Unit-II	Linear growth and decay models, non-linear growth and decay models, Compartment models, Checking model validity, verification of models, Stability	15 Hours

	analysis, Basic model relevant to population dynamics, Epidemics modeling.	
Unit-III	Ecology, Environment Biology through ordinary differential equation, Partial differential equation, Basic theory of linear difference equations with constant coefficients	15 Hours
Unit-IV	Mathematical modeling through difference equations in population dynamics, genetics, Markov chains model, Gambler's ruin model, Stochastic models, Monte Carlo methods.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III

Course-Code: MAT531 **Course Title: Partial Differential Equations**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of	
1.	solution methods of ODE
2.	differential calculus

Course Objectives: To teach	
1	theory of partial differential equations and solution methods.
2	the nature of PDEs like parabolic, elliptic, hyperbolic.
3	Green's Function method to find the solution of Non-homogeneous PDE
4	variational formulation of boundary value problems.

Course Outcomes: Students will be able to	
1.	solve the PDEs independently
2	convert partial differential equations to canonical form.
3	use Green’s function method to solve non-homogeneous PDE
4	apply to Variational formulation of boundary value problems

Course Content:

Unit-I	Formation of PDEs: First order PDE in two and more independent variables, Derivation of PDE by elimination method of arbitrary constants and arbitrary functions. Lagrange's first order linear PDEs, Charpit's method for non-linear PDE of first order, Jacobi's method and Cauchy problem for first order PDEs.	15 Hours
Unit-II	PDEs of second order with variable coefficients: Classification of second order PDEs, Canonical forms of Parabolic, Elliptic and Hyperbolic PDEs, Method of separation of variables for Laplace, Heat and Wave equations.	15 Hours
Unit-III	Eigenvalues and Eigenfunctions of BVP, Orthogonality of Eigen function, D-Almbert's solutions to wave equations, Fundamental solution of Laplace Equation, Green's function for Laplace Equation, Wave equation, Diffusion Equation, Solution of BVP in spherical and cylindrical coordinates.	15 Hours
Unit-IV	General solution of higher order PDEs,, Variational formulation of boundary value problem.	15 Hours

Internal Assessment:

CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Course-Code: MAT532 **Course Title: Game Theory**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have	
1.	knowledge of linear programming and simplex methods.

Course Objective:	
1.	To provide a rigorous treatment of solution concepts for games with perfect and imperfect information including Nash and subgame perfect Nash equilibria.
2.	To cover topics such as auction, VNM utility function, bargaining game, etc.
3.	To provide detailed knowledge about cooperative games.
4.	To teach about games with imperfect information.

Course Outcomes: Students will be able to

1.	model competitive real world phenomena using concepts from game theory and identify optimal strategy and equilibrium solutions for such models.	
2.	learn the two person zero-sum game and its equilibrium solution.	
3.	discuss dynamic games and cooperative games.	
4.	work on strategic and dynamic games with imperfect information.	
Course Content:		
Unit-I	A General Introduction to Game Theory-its Origin, Representation of Games, Type of Game, Games with Perfect Information-Strategic Form Game, Solution Concept- Pure and Mixed Strategies, Dominance and Best Response, Pareto Optimality, Maxmin and Minmax Strategies,	15 Hours
Unit-II	Pure and Mixed Strategies Nash Equilibrium, Existence of a Nash Equilibrium, Two-person Zero-Sum Games-its Solution, Market Equilibrium and Pricing: Cournot and Bertrand Game, Auctions.	15 Hours
Unit-III	Decision Making and Utility Theory, Von Neumann and Morgenstern Utility Function, Theory of Risk Aversion, Equilibrium Theory. Dynamic Games of Perfect Information-Extensive Form Game, Subgame Perfect Nash Equilibrium, Backward Induction, Stackelberg Model of Duopoly. Coalition Games, Core and Shapley Value, Bargaining Game, Illustrations.	15 Hours
Unit-IV	Strategic Games with Imperfect Information -Bayesian Games, Cournot's Duopoly with Imperfect Information. Dynamic Games with Imperfect Information. Finitely and Infinitely Repeated Games, The Folk Theorem, Illustrations.	15 Hours

Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III

Theory: 3 hours/ week	EoSE: 60 Marks	Theory: 3

	Internal Assessment: 40 Marks	
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of

1.	basic concepts of sets

Course Objectives:

1	To teach the students basics of graphs
2	To teach the students the connectivity
3	To teach the students the planar graph
4	To teach the students incidence matrix

Course Outcomes: Students will be able to learn

1.	the concepts of operation on graphs
2	the Eulerian graphs
3	the Kuratowski's theorem
4	the automorphism of graphs

Course Content:

Unit-I	Graphs, Isomorphism of graphs, subgraph, walk, connectedness,	15 Hours

	degree, bipartite graph, Intersection graph, Operations on graphs, graph products, cut point, bridges, blocks	
Unit-II	Tree, Center, Centroid, Connectivity, Line connectivity, Partition, Graphical partition, Eulerian graphs, Hamiltonian graphs, Line graph, Characterization of line graph	15 Hours
Unit-III	Covering, Independence, Planar graphs, Kuratowski's theorem, Chromatic Number, Chromatic polynomial	15 Hours
Unit-IV	Adjacency matrix, Incidence matrix, automorphism groups of graphs, group of composite graph	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination		
Text Books:

Course Code: MAT534 **Course Title: AUTOMATA THEORY AND FORMAL LANGUAGES**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite: Students should have knowledge of		
1.	basic concepts of sets, relations, functions	
2.	basic concepts of propositional logics	
Course Objectives:		
1	To explain why the study of automata is an important part of the core of computer science.	
2	To explain how finite automata are useful models in science and technology.	

3	To develop understanding of the concepts of automata theory and formal languages.	
Course Outcomes: The students will be able to learn		
1.	how automata and formal languages impact our life.	
2	the concepts and topics in hand without haste;	
3	the significance of the concepts defined and the theorems proved here;	
4	the concepts in more generalized form to capture uncertainty and vagueness of complex systems.	
Course Content:		
Unit-I	Theory of Computation: Finite automata, Deterministic and non-deterministic finite automata, equivalence of deterministic and non-deterministic automata, Moore and Mealy machines, Minimization of Automata, Regular expressions.	15 Hours
Unit-II	Conversion of finite automata to Regular expression. Grammars and Languages, Derivations, Language generated by a grammar, Regular language and regular grammar, Context free grammar and context-free language.	15 Hours
Unit-III	Context sensitive grammars and Languages. Context-free grammar in Chomsky normal form, Regular expressions, Formal definition of regular expression, Equivalence of regular expression and finite automata, Kleene's theorem.	15 Hours
Unit-IV	Formal definition of a Turing Machine, Representation of a Turing Machine , Turing machines as language acceptors, Universal Turing machines, decidability, undecidability, Turing Machine halting problem, Rice Theorem.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	

CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Course-Code: MAT535
Course Title: FOUNDATIONS OF SET THEORY

Teaching Scheme	Examination Scheme	Credits Allotted

Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of

1.	basic concepts of sets

Course Objectives:

1	To teach the students the mathematical statements
2	To teach the students the relation and map
3	To teach the students the construction of number systems
4	To teach the students ordinal numbers

Course Outcomes: Students will be able to learn

1.	the Zermelo-Fraenkel axioms of set theory
2	the Peano's axioms
3	the dedekind cut approach
4	the cardinal arithmetic

Course Content:

Unit-I	Mathematical statements, connectives, simple sentence and compound	15 Hours

	sentence, universal quantifiers, Functional Rule and Truth Table, Conjunction, Disjunction, Implication, Tautology and Contradiction, Rules of Inference and Replacement, method of contradiction, Zermelo-Fraenkel axioms of set theory, Class of sets, Russel's Paradox	
Unit-II	Successor set and natural numbers, Ordered pair, Cartesian product, Relations and Maps on sets, Indexing set, Arbitrary intersection and union, Extension of Maps, Fundamental Theorem of Maps, Number Systems, Natural Numbers, Peano's Axioms, Pigeonhole Principle,	15 Hours
Unit-III	Construction of other number systems, Integers and Rational Numbers, Their arithmetic and ordering, Dedekind cut, Real number system as complete ordered field	15 Hours
Unit-IV	$\in$-transitive sets, Ordinals, class of ordinals, Trichotomy law between ordinals, characterization of an ordinal in terms of $\in$-transitive sets, successor and limit ordinals, Principle of Transfinite Induction, Ordinal Arithmetic, Ordinals and well ordered set, Axiom of Choice and its equivalence, The Banach-Tarski Paradox, Cardinals and its arithmetic, ordering of cardinals, countable and uncountable sets, continuum hypothesis	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination

Course Title: PROGRAMMING IN C

Teaching Scheme	Examination Scheme	Credits Allotted
Theory: 3 Hours/week	**EoSE:** 60 Marks **Internal Assessment:** 40 Marks	**Theory:** 3
Lab: 2 Hour/week		**Lab:** 1

		Total: 4
Course Prerequisite: Students should have knowledge of		
1.	basics of set and functions	
Course Objectives: This course aims to learn		
1.	To introduce the basic concepts of computer programming languages.	
2.	To develop the logics for create programs.	
3.	To introduce basic programming constructs	
Course Outcomes: The students will be able to learn		
1.	the concepts of computer programming languages	
2.	the codes the programmes in C language	
3.	the developing of the applications	
Course Content:		
Unit-I	Basic concepts of programming languages: Programming domains, language evaluation criterion and language categories, Describing Syntax and Semantics, formal methods of describing syntax, recursive descent parsing, Dynamic semantics (operational semantics, denotational semantics, axiomatic semantics).	11 Hours Theory and 7 Hours Lab
Unit-II	Names, Variables, Binding, Type checking, Scope and lifetime data types, array types, record types, union types, set types and pointer types, arithmetic expressions, type conversions, relational and Boolean expressions, assignment statements, mixed mode assignment.	11 Hours Theory and 8 Hours Lab
Unit-III	Statement level control structures, compound statements, selection statements, iterative statements, unconditional branching, Character set, variables and constants, keywords, Instructions, assignment statements, arithmetic expression, comment statements, simple input and output.	11 Hours Theory and 7 Hours Lab

Unit-IV	Relational operators, logical operators, control structures, decision control structure, loop control structure, case control structure, functions, subroutines, scope and lifetime of identifiers, parameter passing mechanism, arrays and strings.	12 Hours Theory and 8 Hours Lab
Internal Assessment:		
CIA-I*	Unit-I

Course-Code: MAT537 **Course Title: ALGEBRAIC NUMBER THEORY**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of	
1.	basic concepts of ring and elementary number theory

Course Objective:	
1	To teach the students properties of number fields
2	To teach the students the quadratic fields
3	To teach the students the class group

Course Outcomes: Students will be able to learn	
1.	the arithmetic of algebraic number fields
2	Minkowski's theorem
3	Dirichlet unit theorem

4	the diophantine equation	
Course Content:		
Unit-I	Number fields, the ring of algebraic integers, calculation for quadratic, cubic and cyclotomic cases, norms and traces, integral bases and discriminants,	15 Hours
Unit-II	Dedekind domains, unique factorization of ideals, norm of ideals, factorization of prime ideals in extensions, The ideal class group, lattices in Rn , Minkowski's theorem,	15 Hours
Unit-III	Finiteness of the class number and its consequences, some class number computations, Dirichlet unit theorem, units in real quadratic fields	15 Hours
Unit-IV	Some Diophantine equations, Cubic residue symbol, Jacobi sums, Cubic reciprocity law, biquadratic reciprocity law and Eisenstein reciprocity law	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination		
Text Books:		
1. Esmonde J., Murty M. R., 1999, *Problems in Algebraic Number Theory*, GTM, Springer-Verlag.

Course-Code: MAT538
Course Title: ALGEBRAIC TOPOLOGY

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of		
1.	concepts of general topology	
Course Objectives:		
1	To teach the students one point compactification	
2	To teach the students the fundamental groups	
3	To teach the students the lifting problems and its uniqueness	
4	To teach the students Van Kampen Theorem	
Course Outcomes: The students will be able to learn		
1.	the concepts of pushout and adjunct spaces	
2	The calculation of some fundamental groups	
3	The Deck transformation	
4	The homology groups	
Course Content:		
Unit-I	Review of General Topology, Continuous maps, compactness, one point compactification, Locally compact spaces, Proper maps, Quotient space, Real Projective space, Mobius band, Klein's bottle, torus, Wedge product, Co-product of groups, pushout, adjunct spaces, Cone	15 Hours
Unit-II	Path, Homotopy, Reparametrization, First fundamental groups,	15 Hours

	Simply connected spaces, Category and functors between categories, Category of pointed topological space, Functorial property of fundamental group, Retraction map, Brower's fixed point theorem, fundamental group of product spaces,	
Unit-III	Deformation Retract, Covering projections, the lifting problems and its uniqueness, lifting of path and homotopy, Action of fundamental groups on fibers, regular covering, Deck transformation, group of Deck transformations, its action on fibres	15 Hours
Unit-IV	Van Kampen Theorem, fundamental group of some adjunct spaces, n-simplex, face maps, chain, boundary operator, Chain complexes, homology groups, Convex sets and barycentric coordinates, Homotopy invariance of homology, Mayer Vitory sequence and its applications, Maps on sphere and degree	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV

Course-Code: MAT539 **Course Title: An Introduction to Fuzzy Set Theory and Fuzzy Logic**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite: Students should have the knowledge of		
1.	classical set theory, and two-valued logic.	
Course Objective:		
1.	To provide the basic knowledge of the fuzzy sets, operations and their properties.	
2.	To teach them the fundamental concepts of fuzzy functions and fuzzy relational calculus.	

3.	To teach them fuzzy logic in detail.	
4.	To teach them fuzzy numbers and evidence theory.	
Course Outcomes: Students should be able to learn		
1.	the significance, need and applications of concepts of fuzziness.	
2.	the fundamental concepts of Fuzzy functions and Fuzzy logic	
3.	the fuzzy numbers and its types.	
4.	how to apply evidence theory.	
Course Content:		
Unit-I	Crisp sets vs fuzzy sets: Membership function types and properties, Chance versus fuzziness, Level sets, Cardinality and fuzzy cardinality, Set theoretic operations on fuzzy sets, Inclusion and Difference, Fuzzy compliments, Fuzzy intersections: t-Norms, Fuzzy unions: t-Conorms, Algebraic operations, Averaging operators. Alpha-cut decomposition principle,	15 Hours
Unit-II	Extension principle. Crisp versus fuzzy relations, Projections, Composition of fuzzy relations, Fuzzy binary relations, Fuzzy n-ary relation, transitive closure, Fuzzy equivalence relations. Classical logic an overview, : Introduction to propositional Logic, Boolean Algebra, Multi valued logic,	15 Hours
Unit-III	Fuzzy logic, Linguistic hedges, Fuzzy propositions (conditional and unconditional), Approximate reasoning, Implication operations, Natural language, Fuzzy qualifiers, Inference from conditional and qualified fuzzy propositions, Fuzzy Quantifiers, Inference from quantified fuzzy propositions.	15 Hours
Unit-IV	Fuzzy numbers, Types of fuzzy numbers, Linguistic variables, Fuzzy arithmetic: Extension principle and Interval arithmetic, Fuzzification, Defuzzification, Methods of Defuzzification. Fuzzy measures, Evidence	15 Hours

	theory, Necessity and belief measures, Probability measures vs possibility measures.	
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Course-Code: MAT540 **Course Title: Celestial Mechanics**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**

Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite:	
	Basics of linear algebra, analytical geometry, differential equations, and vector calculus.
Course Objective: To develop the concept of	
1.	motion of space objects via Kepler's laws of planetary motion and Newton's laws of motion and visualization of different paths/orbits of moving mass.
2.	moving frame of reference and its relation to fixed frame along with formulation and special solutions and applications of three body problems.
3.	stable/unstable equilibrium points and their applications along with formulation and applications of different kinds of restricted three body problems.
4.	different kinds of perturbations in space and their impacts on small space objects (e.g. asteroid, satellite, space craft etc.) along with normal form and its application.
Course Outcomes: Students will be able to	
1.	learn about planetary motion of space objects and visualize their orbits/paths.
2.	know the need of different kinds of frames of reference and understand the formulation and importance of special solutions of three body problems.
3.	verify the stable/unstable equilibrium points and understand the applications of stable points along in addition with applications of different kinds of restricted three body

	problems.	
4.	understand about the different kinds of perturbations in space and their impacts on small space objects (e.g. asteroid, satellite, space craft etc.) along with application of normal form for stable motion.	
Course Content:		
Unit-I	Introduction, Kepler's Laws of Planetary Motion, Central force motion, Differential equation of orbit, Inverse square force and Geometry of orbits, Relative motion in two body problem, Earthbound satellite circular orbit, Classical orbital elements, Kepler's equation and its applications.	15 Hours
Unit-II	Moving frame of reference, Derivative of a vector in a rotating frame, motion of a mass relative to rotating frame, Uniform rotating frame, General three body problem, Integrals of motion, Lagrange's special solutions.	15 Hours
Unit-III	Circular RTBP, Lagrangian points and their stability, Zero velocity curves, Elliptic RTBP, Equilibrium points, Existence of ZVC, Introduction of Robe's RTBP, Hill's problem, Sitnikov problem and their applications.	15 Hours
Unit-IV	Introduction of perturbations factors, potential of oblate body, effective force of radiating body, potential due to disc or belt like structure. Introduction of normal form, Hamiltonian function, Normalization of Hamiltonian function of Circular RTBP and its applications.	15 Hours
Internal Assessment:		
CIA*-1	Unit I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Written Exam. for Unit-I, II, III, & IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Course Title: COMPUTATIONAL ODE

Teaching Scheme	Examination Scheme	Credits Allotted

Theory: 3 Hours/week	**EoSE:** 60 Marks **Internal Assessment:** 40 Marks	**Theory:** 3
Tutorial: 1 Hour/week		**Tutorial:** 1
		Total: 4

Course Prerequisite: Students should have knowledge of	
1.	basics of Linear Algebra
2.	basics of Differential Equations
3.	basics of Numerical Methods
Course Objective: This course aims to learn	
1.	the numerical techniques for IVP and BVP
2.	the convergence and stability of finite difference schemes
3.	the finite difference method for differential equations.
4.	the finite element methods for differential equations.
5.	the application of numerical techniques in real life problems.
Course Outcomes: The students will be able to	
1.	obtain numerical solutions and the concepts of consistency, stability, convergence and error analysis.
2.	check the stability and convergence of numerical methods.
3.	solve numerically linear and nonlinear ordinary differential equations.
4.	find the numerical solution to ODEs by using a computer program.
5.	apply various numerical methods in real life problems.

Course Content:		
Unit-I	Numerical solutions of systems of simultaneous first order differential equations and second order initial value problems (IVP) by Euler and Runge-Kutta explicit methods, numerical solutions of second order boundary value problems (BVP) of first, second and third types by shooting method.	15 Hours
Unit-II	Types of finite difference schemes of second order BVP based on difference operators (solutions of tridiagonal system of equations), solutions of such BVP by Newton-Cotes and Gaussian integration rules, convergence and stability of finite difference schemes.	15 Hours

Unit-III	Variational principle, approximate solutions of second order BVP of first kind by Rayleigh-Ritz, Galerkin, collocation and finite difference methods,	15 Hours
Unit-IV	Finite Element methods for BVP-line segment, triangular and rectangular elements, Ritz and Galerkin approximation over an element, assembly of element equations and imposition of boundary conditions.	15 Hours
Internal Assessment:		
CIA-I*	Unit-I	
CIA-II	Written Exams/ Quizzes/ Assignment/ Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I, II, III, IV

Course Title: COMPUTATIONAL PDE

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 Hours/week	**EoSE:** 60 Marks **Internal Assessment:** 40 Marks	**Theory:** 3
Tutorial: 1 Hour/week		**Tutorial:** 1
		Total: 4

Course Prerequisite: The student should have knowledge of	
1.	basic of Linear Algebra
2.	basic of Differential Equations
3.	basic of Numerical Methods
Course Objective: This course aims to learn	
1.	the numerical techniques for partial differential equations
2.	the convergence, truncation errors and stability of finite difference schemes
3.	the explicit methods for partial differential equations.
4.	the implicit methods for partial differential equations
5.	the finite element methods for partial differential equations.
6.	the application of numerical techniques in real life problems.
Course Outcomes: The students will be able to	
1.	obtain numerical solutions and the concepts of truncation errors, stability, convergence.
2.	check the stability and convergence of numerical methods.
3.	solve numerically parabolic, elliptic and hyperbolic equations.
4.	find the numerical solution to PDEs by using a computer program.
5.	apply various numerical methods in real life problems.
Course Content:	

Unit-I	Numerical solutions of parabolic equations of second order in one space variable with constant coefficients:- two and three levels explicit and implicit difference schemes, truncation errors and stability, Difference schemes for diffusion convection equation,	15 Hours
Unit-II	Numerical solution of parabolic equations of second order in two space variables with constant coefficients-improved explicit schemes, implicit methods, alternating direction implicit (ADI) methods.	15 Hours
Unit-III	Numerical solution of hyperbolic equations of second order in one and two space variables with constant and variable coefficients-explicit and implicit methods, alternating direction implicit (ADI) methods.	15 Hours
Unit-IV	Numerical solutions of elliptic equations, Solutions of Dirichlet, Neumann and mixed type problems with Laplace and Poisson equations in rectangular, circular and triangular regions, Finite element methods for Laplace, Poisson, heat flow and wave equations	15 Hours

Internal Assessment:

CIA-I*	Unit-I

Course Title: DIFFERENTIAL GEOMETRY

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of calculus

Course Objective:

1.	To introduce the basic concept of smooth manifolds with a variety of examples
2.	To elaborate the basic notions of smooth maps between manifolds and tangent spaces.
3.	To convey applications of manifolds

Course Outcomes: On completion of course, students will be able to learn

1.	the concepts of smooth manifold, smooth map, and tangent space.
2.	the inverse function theorem to describe the local structure of immersions and submersions;

3.	the applications and significances of topic in hands.	
Course Content:		
Unit-I	Smooth manifold, chart and atlas, Compatible charts, Smooth maps between manifolds, Diffeomorphisms, Partial derivatives on manifolds, the inverse function theorems, Quotient manifolds	15 Hours
Unit-II	Real projective spaces, Standard smooth atlas for real projective space, Tangent spaces, Differential of a map, local expressions for differentials, Immersions and submersions, Rank, critical and regular points,	15 Hours
Unit-III	Submanifolds and level sets, the rank of a smooth maps, Whitney's embedding theorem; Tangent bundle, Smooth sections and smooth frames, Vector fields and local flows.	15 Hours
Unit-IV	Differential 1-Forms, Cotangent bundle, Characterization of smooth 1-Forms, Pullback of 1-forms, Differential k-Forms, local expression for k-Form, Pullback of k-Forms, the Wedge Product, Differential forms on a circle.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination

Course-Code: MAT 544
Course Title: Differential Equations & Dynamical Systems

Teaching Scheme	Examination Scheme	Credits Allotted
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	differential Equations, calculus and linear algebra

Course Objective:

1.	To introduce the theory, properties and applications of various dynamical systems
2.	To make the students familiar with stable and unstable subspaces and manifolds
3.	To teach an important theorems: Hartman-Grobman, stable manifold
4.	To introduce center manifold theory and normal form theory
5.	To discuss global existence theorem and Poincare-Bendixon theory

Course Outcomes: The students will be able

1.	to analyze and solve system of linear differential equations
2.	learn theory of nonlinear system: existence, maximal interval of existence and linearization
3.	to apply different important theorem and theories e.g., Hartman-Grobman, stable

	manifold theorems, centre and normal form theory	
4.	to learn global existence theorem	
5.	to discuss about limit sets, limit cycles and periodic orbits for a given dynamical system	
Course Content:		
Unit-I	Linear Systems: Exponentials of operators, Planar linear systems and their phase portraits, complex eigenvalues, multiple eigenvalues, Jordon forms, Stability theory	15 Hours
Unit-II	Generalized eigenvectors and invariant subspaces, Non-homogeneous linear systems, Nonlinear Systems: The fundamental existence-uniqueness theorem, The maximal interval of existence, The flow defined by a differential equation, Linearization, The stable manifold theorem, The Hartman-Grobman theorem	15 Hours
Unit-III	Stability and Lyapunov functions, Saddles, Nodes, Foci and Centers, Center manifold and Normal form theory, Dynamical systems and global existence theorems, Limit sets and Attractors, Periodic orbits	15 Hours
Unit-IV	Limit Cycles, and Seperatrix cycles, Poincare map, Stable manifold theorem for periodic orbits, Poincare-Bendixon theory in xy-plane, Lineard Systems, Bendixson's Criteria.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I, II, III, IV	
*: Continuous Internal Assessment **: End of Semester Examination

Course Title: Financial Mathematics

Teaching Scheme	Examination Scheme	Credits Allotted
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	elementary Mathematics and Probability

Course Objective:

1.	To provide the theoretical foundations required to understand the financial mathematics
2.	To make the students familiar with the concepts life insurance contracts.
3.	To teach Black Scholes model and Black Scholes equation
4.	To introduce Binomial methods and Monte Carlo simulation
5.	To discuss finite difference methods

Course Outcomes: The students will be able to learn

1.	theoretical foundations required to understand the financial mathematics
2.	binomial methods
3.	how to do Monte Carlo simulation

4.	finite difference methods	
Course Content:		
Unit-I	Introduction to options and markets: types of options, interest rates and present values, Black Scholes model : arbitrage, option values, pay offs and strategies, put call parity, Black Scholes equation	15 Hours
Unit-II	Similarity solution and exact formulae for European options, American option, call and put options, free boundary problem, Binomial methods: option valuation, dividend paying stock, general formulation and implementation	15 Hours
Unit-III	Monte Carlo simulation : valuation by simulation, Lab component: implementation of the option pricing algorithms and evaluations for Indian companies, different concepts associated with Finite difference methods	15 Hours
Unit-IV	Finite difference methods: explicit and implicit methods with stability and conversions analysis methods for American options- constrained matrix problem, projected SOR, time stepping algorithms with convergence and numerical examples	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I, II, III, IV	
*: Continuous Internal Assessment **: End of Semester Examination

Course Title: ADVANCED COMPLEX ANALYSIS

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of Complex Analysis.

Course Objective:

To teach some topics of contemporary complex analysis.

To prepare the student to independent work in these topics

To teach the methods of complex analysis in other areas of mathematics.

Course Outcomes: The students will be able to learn		
basic techniques of contemporary complex analysis		
applications of these techniques in harmonic analysis		
univalent functions theory and special functions.		
Course Content:		
Unit-I	Liouville's theorem and its different proofs, Picard's little theorem, Picard's great theorem, Week form of Picard's great theorem, Casorati-Weierstrass theorem, Harmonic conjugate, Transformation of harmonic functions, Transformations of boundary conditions.	15 Hours
Unit-II	Applications of conformal mappings, Steady temperatures, Steady temperature in a half plane and related problems, Electrostatic Potentials, Potential in cylindrical space, Open mapping theorem, Hurwitz' theorem, Analytic continuation, Direct analytic continuation Poisson integral formula, Dirichlet problem.	15 Hours
Unit-III	Infinite sums, Mittag-Leffler theorem, Infinite product of complex numbers, Convergence of infinite products, Infinite product of analytic functions, Factorization of entire functions, Gamma functions, Riemann Zeta functions, Euler product formula, Riemann Functional equations, Riemann hypothesis.	15 Hours
Unit-IV	Univalent functions, Basic results of univalent functions, Class *S*, Area theorem, Biberbach theorem and conjecture, Koebe 1⁄4 theorem, Riemann mapping theorem.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination		

Text Books:

1. Brown J.W., and Churchill R.V., 2009, *Complex Variables and Applications*, McGraw Hill
2. Ponnusamy S., 2005, *Foundations of Complex Analysis*, Narosa Publication House.
3. Kasana H.S., 2005, *Complex Variables: Theory and Applications*, PHI.

Reference Book

Course Code: MAT547

Course Title: FUNCTIONS OF SEVERAL REAL VARIABLES

Teaching Scheme	Examination Scheme	Credits Allotted
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of

1.	basic concepts of calculus of one variables

Course Objectives:

1	To explain how some concepts of calculus can be generalized in higher dimensions.

2	To introduce multivariable calculus: different types of derivatives, chain rule, mean value theorem, maxima and minima, implicit and inverse function theorems.	
3	To explain how these generalized concepts impact inventions in science, technology and our daily life.	
Course Outcomes: The students will be able to learn		
1.	how existing concepts of calculus of one variable or two variable can be generalized in higher dimensions	
2	the significance of the concepts defined and the theorems proved here;	
3	the importance of these generalized concepts impacts science, technology and our daily life.	
Course Content:		
Unit-I	R^n as inner product and as normed space, convergence of sequences, compactness, equivalence of norms, connected and convex sets, Functions from R^n to R^m, limit and continuity, Directional derivatives, partial derivatives of a function of several real variables.	15 Hours
Unit-II	Differentiability of a function of several real variables , sufficient conditions for continuity and differentiability of a function of several real variables in terms of partial derivatives, algebra of differentiable functions, Chain rule of differentiation, Total differentials.	15 Hours
Unit-III	Mean value Theorem for real valued functions, homogeneous functions and Euler's Theorem, Equality of mixed derivatives, Young's and Schwarz Theorems, higher differentials, Taylor's Theorem.	15 Hours
Unit-IV	Maxima and minima for real valued functions of several real	15 Hours

	variables, (necessary and sufficient conditions), saddle points, Lagrange's multipliers, Hessian matrix, Jacobian matrix and determinants, Implicit and Inverse function Theorems, Functional dependence..	
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Text Books:

1. Lang S, 1987, *Calculus of Several Variables*, Springer-Verlag, New York.

Course-Code: MAT548 **Course Title: LIE ALGEBRAS**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4
Course Prerequisite: Students should have knowledge of		
1.	concepts of linear algebra	
Course Objectives:		
1	To teach the students how to utilize various techniques for working with Lie algebras	
2	To teach the students the parts of a major classification result	
3	To teach the students the representations of sl(2, C)	
4	To teach the students root Space Decomposition	
Course Outcomes: Students will be able to learn		

1.	the construction of Lie algebra	
2	The low-dimensional Lie algebras	
3	The semisimple Lie Algebras	
4	The root system	
Course Content:		
Unit-I	Definition of Lie Algebras, Some Examples, classical Lie Algebras, Subalgebras and Ideals, Homomorphisms, Derivations, Structure Constants, Ideals and Homomorphisms, Constructions with Ideals, Quotient Algebras, Correspondence between Ideals,	15 Hours
Unit-II	Low-Dimensional Lie Algebras, Dimensions 1,2and3, Solvable Lie Algebras, Nilpotent Lie Algebras, Subalgebras of gl(V), Weights, The Invariance Lemma , Engel's Theorem, Lie's Theorem, Some Representation Theory , Definitions, Examples of Representations, Modules for Lie Algebras, Irreducible and Indecomposable Modules, Schur's Lemma	15 Hours
Unit-III	Representations of sl(2, C), Classifying the Irreducible sl(2, C)-Modules, Weyl's Theorem, Cartan's Criteria, Jordan Decomposition , Testing for Solvability, The Killing Form, Testing for Semisimplicity, Derivations of Semisimple Lie Algebras	15 Hours
Unit-IV	The Root Space Decomposition, Cartan Subalgebras, Subalgebras Isomorphic to sl(2, C), Root Strings and Eigenvalues, Cartan Subalgebras as Inner-Product Spaces, Root Systems, Bases for Root Systems, Cartan Matrices and Dynkin Diagrams	15 Hours
Internal Assessment:		

CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Course Title: MODULE THEORY

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	concepts of rings and linear algebra

Course Objective:

1	To teach the students linear algebra over certain rings
2	To teach the students the basic definitions and elementary results
3	To teach the students the classification of finitely generated abelian groups
4	To teach the students Jordan Canonical form

Course Outcomes: The students will be able to learn

1.	the concepts of isomorphism theorems
2	the projective and injective modules
3	the torsion and torsion-free modules
4	the Jordan canonical form

Course Content:		
Unit-I	Modules over a ring, Endomorphism ring of an abelian group, R-Module structure on an abelian group M as a ring homomorphism from R to EndZ (M), submodules, Direct summands, Annihilators, Faithful modules, Homomorphism, Factor modules, Isomorphism theorems	15 Hours
Unit-II	Free Module, Noethrian and Artinian Module, Hilbert basis theorem, Wedderburn Artin Theorem, Split exact sequences and their characterizations, Left exactness of Hom sequences and counterexamples for non-right exactness, Projective modules, Injective modules, Baer's characterization, Divisible groups, Examples of injective modules. (M, M) as a ring, Exact sequences, Five lemma,	15 Hours
Unit-III	External and internal direct sums and their universal property, Submodules of finitely generated free modules over a PID, Torsion submodule, Torsion and torsion-free modules, Direct decomposition into T(M) and a free module, primary components, Decomposition of p-primary finitely generated torsion modules	15 Hours
Unit-IV	Elementary divisors and their uniqueness, Decomposition into invariant factors and uniqueness, Reduction of matrices over polynomial rings over a field, Similarity of matrices and F[x]-module structure, Rational canonical form of matrices, Elementary Jordan matrices, Reduction to Jordan canonical form, Diagonalizable and nilpotent parts of a linear operator, Smith normal form over PID, Uniqueness of Smith normal form	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	

*: Continuous Internal Assessment
**: End of Semester Examination

Course Title: NONLINEAR DYNAMICS & CHAOS

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1

		Total: 4
Course Prerequisite: Students should have knowledge of		
1.	differential equations and calculus	
Course Objectives:		
1.	To provide knowledge of different topics in Nonlinear dynamics and chaos	
2.	To teach one dimensional systems and different types of bifurcations	
3.	To introduce some real model systems and applications of one dimensional bifurcations and stability theory	
4.	To introduce two dimensional systems and associated bifurcations	
5.	To discuss one dimensional maps and different topics in chaos	
Course Outcomes: The students will be able to learn		
1.	different topics in nonlinear dynamics and chaos	
2.	bifurcations for one dimensional system and associated applications	
3.	bifurcation theory for two dimensional systems and application	
4.	different aspects associated with chaos and applications	
Course Content:		
Unit-I	The importance of being nonlinear, A dynamical view of the world, One dimensional flows: Flows on the lines: a	15 Hours

	geometric way of thinking, Fixed points, Local stability analysis, Overdamped beam on a rotating hoop, Existence and Uniqueness, Impossibility of oscillations, Potentials, Bifurcations: Saddle-node bifurcations, Transcritical and Pitchfork bifurcations, Supercritical and Subcritical Pitchfork bifurcations, Laser threshold, Imperfect bifurcations and Catastrophes	
Unit-II	Insect outbreak: Model, Dimensionless formulation, Analysis of fixed points, Two dimensional flows: Linear systems, Definitions and examples, Classification of linear systems, Dynamics of love affairs, Rabbit Versus Sheep, Conservative Systems, Limit cycles, Ruling out closed orbits, Poincare-Bendixson theorem, Lienard systems, Weakly nonlinear oscillators,	15 Hours
Unit-III	Bifurcations in case of two dimensional systems, Hopf-bifurcations in aeroelastic stabilities and chemical oscillators, Global bifurcations of cycles, chaotic waterwheels, waterwheel equations and Lorentz equations, Chaos in the Lorentz equations, Strange attractor of Lorentz equations	15 Hours
Unit-IV	One dimensional map, Universal aspects of periodic doubling, Feigenbaum's renormalization analysis and periodic doubling, Renormalization: Function space and hands-on calculation, Fractals and the geometry of strange attractors, Henon map, Using chaos to send secret messages	15 Hours
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I, II, III, IV	
*: Continuous Internal Assessment **: End of Semester Examination		

Text Books:

1. Strogatz S., 2001, *Nonlinear Dynamics and Chaos*, Springer.

2. Ermentrout B., 2005, *Simulating Analyzing and Animating Dynamical Systems*, SIAM.

3. Hirsch M. W., Smale S. and Devaney R. L., 2002, *Differential Equations, Dynamical Systems and an Introduction to Chaos*, Academic Press.

Course-Code: MAT551
Course Title: FIELDS AND GALOIS THEORY

Teaching Scheme	Examination Scheme	Credits Allotted

Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of

1.	groups and rings

Course Objective:

1	To teach the students symmetries of roots of a polynomial
2	To teach the students the solubility in terms of simple algebraic formulae
3	To teach the students the algebraic properties of field extensions
4	To teach the students geometric problems such as doubling the cube

Course Outcomes: Students will be able to learn

1.	the algebraic extension
2	the splitting field
3	the Finite field
4	the construction of regular polygon

Course Content:

Unit-I	Eisenstein's irreducibility criterion, Characteristic of a field, Prime subfields, Field extensions, Finite extensions, Simple extensions, Algebraic and transcendental extensions. Factorization of polynomials in extension fields. Splitting fields and their uniqueness.	15 Hours
Unit-II	Separable field extensions, Perfect fields, Separability over fields of prime characteristic, Transitivity of separability, Automorphisms of fields, Dedekind's theorem, Fixed fields, Normal extensions, Splitting fields and normality, normal closures,	15 Hours
Unit-III	Galois extensions, Fundamental theorem of Galois theory, Computation of Galois groups of polynomials., Primitive element theorem, Finite fields, Existence and uniqueness, Subfields of finite fields, Characterization of cyclic Galois groups of finite extensions of finite fields, fundamental theorem of algebra	15 Hours
Unit-IV	Cyclotomic extensions and polynomials, cyclic extensions, Solvability by radicals, Galois' characterization of such solvability, Generic polynomials, Abel-Ruffini theorem, geometrical constructions, construction of real number by ruler and compass, Impossibility of trisection of angle, Construction of regular polygon	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination		
Text Books:		
1. Dummit D. S. and Foote R. M., 2003, *Abstract Algebra*, John Wiley & Sons, New York.		
2. Hungerford T. W., 2004, *Algebra*, Springer (India), Pvt. Ltd.		

3. Roman S., 2007, *Field Theory*, Springer, New York.

4. Stewart I. N., 2004, *Galois Theory*, Chapman & Hall, New York.

Course-Code: MAT552
Course Title: Operations Research

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of

1.	mathematical programming
2.	probability theory

Course Objective:

1.	To teach how to determine an optimal sequence out of a series of jobs.	
2.	To teach the PERT/CPM techniques to plan, schedule, and control project activities.	
3.	To teach solution methodologies for deterministic and probabilistic inventory models.	
4.	To introduce the basic concepts of stochastic processes.	
5.	To teach what is a queueing model and how to analyze some specific queueing models.	
Course Outcomes: Students will be able		
1.	to find the optimal job sequencing.	
2.	to get a deep understanding of the PERT/CPM techniques to plan, schedule, and control project activities.	
3.	to learn deterministic and probabilistic inventory models.	
4.	to learn the basic concepts of stochastic processes.	
5.	to learn the theory behind queueing models and to characterize a queue & its key performance indicators.	
Course Content:		
Unit-I	Job sequencing: Principal assumptions, processing n jobs through m machines. Project management by PERT-CPM technique: Network representation, critical path computations, construction of the time schedule, project evaluation and report technique.	15 Hours
Unit-II	Deterministic inventory models: General Inventory models, static economic order quantity (EOQ) model, dynamic EOQ models, deterministic models with price breaks. Review of Probability theory, Probabilistic Inventory models, Probabilistic EOQ model, Single period model.	15 Hours
Unit-III	Stochastic processes, Classification and its properties**,** Markov process, types of Markov processes, infinitesimal generator matrix, transition probability matrix, steady state distributions, transient distributions.	15 Hours
Unit-IV	Queueing models: Elements of Queueing models, Kendall notations, Poisson process, pure birth model,	15 Hours

	pure death model, birth-death model, Chapman-Kolmogorov equations, Little's Law, distribution of waiting time and response time, Burke's Theorem, M/M/1 model, M/M/1/N models.	
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit II and III	
EoSE**	Unit-I,II,III,IV

Course-Code: MAT553 **Course Title: REPRESENTATION THEORY OF FINITE GROUPS**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: Students should have knowledge of	
1.	concepts of groups and module

Course Objective:	
1	To teach the students the representation theory of finite groups
2	To teach the students the finite dimensional algebras
3	To teach the students Maschke's Theorem
4	To teach the students the character of the representation

Course Outcomes: Students will be able to learn	
1.	the concepts of Faithful Representation
2	the group algebra

3	the Schur's lemma	
4	the character of the representation	
Course Content:		
Unit-I	Representation of into group of Matrices, Examples, Faithful Representation, Equivalent Representation, FG-module, Equivalent formulation of Representation as FG module,	15 Hours
Unit-II	Permutation module, FG-submodule, Irreducible Representation, Group algebra, Regular FG-module, Action of FG on FG-module, FG-homomorphism, FG-isomorphism, Direct sum of FG-submdule	15 Hours
Unit-III	Maschke's Theorem, Completely reducible FG-submodule, Schur's Lemma and its application, Representation of abelian groups, Irreducible submodules of CG-module, Composition factor,	15 Hours
Unit-IV	Character of the representation, class function, Character table, irreducible characters, degree of character, regular and permutation character, Orthogonality relation between characters.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination

Course Title: SPECIAL FUNCTIONS

Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3
Tutorial: 1 Hour/Week		Tutorial: 1
		Total: 4

Course Prerequisite: The student should have knowledge of Complex Analysis.

Course Objectives: To demonstrate

the fundamentals of special functions including Gamma functions,		
Riemann Zeta functions, Hypergeometric functions, Generalized Hypergeometric functions		
Bessel functions, Legendre polynomials, Hermite Polynomials and Laguerre Polynomials.		
Course Outcomes: Students will be able to learn		
Gamma functions		
Hypergeometric functions		
Basic theory, property and applications of special functions		
Course Content:		
Unit-I	Infinite product of complex numbers, Factorization of entire functions, Gamma functions, Order symbols o and O, Beta functions, Euler reflection formula, Factorial function, Legendre's duplication formula, Gauss's multiplication formula, Integral representations for Gamma function and Beta functions, Walli's products, Stirling formula.	15 Hours
Unit-II	Asymptotic expansion, Riemann Zeta functions, Euler product formula, Riemann Functional equations, Riemann hypothesis, Gauss Hypergeometric Function, Elementary Properties, Conditions of convergence, Contiguous function relations, Integral Representation, Simple transformation, Quadratic transformation.	15 Hours
Unit-III	Generalized Hypergeometric Functions, Integral representation, Elementary Properties, Integral Representation, Legendre polynomials and functions, Solution of Legendre's differential equations, Generating Functions, Rodrigue's Formula,	15 Hours

	Orthogonality of Legendre polynomials, Recurrence relations.	
Unit-IV	Bessel functions, Bessel differential equation and it's solution, Recurrence relation, Generating functions, Integral representation, Hermite Polynomials, Laguerre Polynomials.	15 Hours
Internal Assessment:		
CIA*-1	Unit -I, II	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce based on Unit III	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination		
Text Books:		
1. Rainville E. D., 1960, *Special Functions, The MacMillan Comp.* 2. Bell W.W., 1968, *Special Functions for Scientists and Engineers, D. Van Nostrand Comp. Ltd.* 3. Andrews G.E., Askey R. and Roy R., 1999, *Special Functions, Encyclopedia of Mathematics and Its Applications,* Cambridge University Press.		
E-resources:		

Course-Code: MAT-555 **Course Title: Mathematics for Machine Learning**		
Teaching Scheme	**Examination Scheme**	**Credits Allotted**
Theory: 3 hours/ week	EoSE: 60 Marks Internal Assessment: 40 Marks	Theory: 3

Practical: 2 Hours/Week		Practical: 1
		Total: 4

Course Prerequisite: The student should have knowledge of

1.	Basic knowledge in Calculus, LInear Algebra and Probability Theory
2.	Basic knowledge in python programming

Course Objective:

1	To teach about Principal Component Analysis and Linear Discriminant Analysis.
2	To teach about different regression methodologies
3	To teach various optimization methodologies.
4	To teach support vector machines.

Course Outcomes: The students will be able to

1.	apply theoretical and numerically PCA and LDA.
2	understand regression techniques.
3	find the optimal solution by different optimization methodologies.
4	apply the concept of support vector machines in real life problems.

Course Content:

Unit-I	Basics concepts of Calculus and Linear Algebra, Linear Transformations, Orthogonal Complement and Projection Mapping, Eigenvalues and Eigenvectors, Special Matrices and Properties. Spectral Decomposition, Singular Value Decomposition, Low Rank Approximations, Principal Component Analysis, Linear Discriminant	11 Hours Theory and 8 Hours Lab

	Analysis, Python Implementation of these methodologies.	
Unit-II	Review of Probability Concepts, Least Square Approximation and Minimum Normed Solution, Linear and Multiple Regression, Logistic Regression, Python Implementation.	11 Hours Theory and 7 Hours Lab
Unit-III	Introduction to Optimization, Convex sets and convex functions, properties of convex functions, Various Optimization algorithms: Gradient Descent and others, Python Implementation of Optimization.	11 Hours Theory and 8 Hours Lab
Unit-IV	Discrete and continuous distribution functions, joint probability and covariance, Separating Hyperplanes, Primal and Dual Support Vector Machines, Kernels and Python Implementation.	12 Hours Theory and 7 Hours Lab
Internal Assessment:		
CIA*-1	Unit -I	
CIA-II	Written Exams/ Quizzes /Assignment /Presentations/ Viva-Voce	
EoSE**	Unit-I,II,III,IV	
*: Continuous Internal Assessment **: End of Semester Examination

Summer Internship (at least 6 weeks)
(TO BE WRITTEN)

Major Project Dissertation in Mathematics
(TO BE WRITTEN)

CC - Core Course	72 Credits
AECC – Ability Enhancement Compulsory Course	16 Credits

Total Credits of Core Courses	72+16=88 Credits
DE- Departmental Specific Elective Courses offered by the Department	32 Credits
GE - Generic Elective Courses offered by any department of the University	24 Credits
Total Credits of Elective Courses	56 Credits
MOOC	16 Credits
